# Usenet Newsgroup Archive: comp.sys.atari.st

## 2007 - 2013

These Usenet messages were preserved as a plain-text archive. This PDF was generated by Kay Savetz from the source text file in 2026.

Date span: 2007-01-01 through 2013-06-10

Source text: comp.sys.atari.st.txt

Source item: https://archive.org/details/usenet-comp

Messages included in this PDF: 6,532

Messages are presented chronologically by archived date.

Binary or encoded payloads are not printed as blocks of encoded text; a placeholder appears where such material was detected. The original source text is unchanged.

## 1. Need Atari Items....

Newsgroup: comp.sys.atari.st
Date: 2007-01-01 06:11:55 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <vC1mh.16756$h_1.1020@bignews6.bellsouth.net>
Source record: 6565

Greetings,

Looking for the following Atari Items...

Atari STe-Falcon RGB type monitor cables.

Used Original Software....
CD Recorder by SoundPool.
Apex Media versions between 2.00 and 2.41.
Digital Home Studio with or without Data CD.
CUBASE CD.
Squash It!
SEURAT.
Hollywood Hustler (game).
DogFight (game by MicroProse).
PhotoShow Pro Falcon.
Guitar Dreams by SoundPool.
4T/FX and D2D Edit (for the Atari Falcon) This is a
early D2D program and I really need a copy of this one!

Hardware.....
Atari Falcon DSP Audio Hardware such as FAD/JAM PRO
and etc.
Non working Atari Falcon computers and related hardware.
ScreenEYE Digitiser for Atari Falcon.
Expose Digitiser for Atari Falcon.
Replay 16 Cartridge and Software.

Also, Looking for all types of hardware upgrades for all
Atari STE, MegaST, Mega STE and Falcon 030 Computers.

Respond in e-mail only please. I will answer any replies, but
sometimes it takes a few days.
Located in USA but Overseas items are welcome!

Will Buy, Trade, or take for free and pay postage.

E-mail detail of item(s) to me at....
phantomm@bellsouth.net

Thanks,
Phantom

## 2. OASIS Version 2.xx

Newsgroup: comp.sys.atari.st
Date: 2007-01-01 06:16:45 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <1H1mh.16758$h_1.5507@bignews6.bellsouth.net>
Source record: 6566

Years ago, there was some work on a
version of OASIS above 1.35 that included Web
support.

I have some old e-mails from Oasis 2.11 or something
like that.

Anyone know if any part of this Oasis did work?

I used Oasis 1.35 for along time for News and E-mail.
And still like it.

phantomm@bellsouth.net

## 3. Need STacy TrackBall

Newsgroup: comp.sys.atari.st
Date: 2007-01-01 06:21:45 UTC

Even before Christmas.

>
> Is the server down?

Unfortunately yes and it does seems like it will be so in the near
future.

You see, the sysadmins of the RMA are students and every 6 monts or so
there is a new sysadmin. In the past they were all very co-operative
but the new one is some kind of a stupid guy and isn't that
co-operative.

Some time ago the servers of the RMA were attacked by spam (sic.
sysadmin). As a result of that he closed down every server, included
the ftp-server. He promished when the spam problem was solved he would
take a look at the ftp-server again. But since then we (Saka and I)
haven't heard from him a single word.

As Saka and I are not affiliated to the RMA there is nothing we can do
then write mails to that guy and hope some day he will see the light.

Anyway, I wish all the Atarians a Happy New Year

CU

Oasis 2.x was just a piece of junk. I was one of the few registrated users. There was no way I could make a connection to my ISP. The first few weeks the authors were helping me but soon after that they disappeared.

The newsreader itself was pretty good though.

>
> I used Oasis 1.35 for along time for News and E-mail.

I've used it a long time myself and I did like it. I found it better then Newsie.

Now I using Okami but unfortunately I can't use Okami to post messages as Newswatch can't cope with User authentication of my ISP.

To post I use Troll which does it's job but that's that. It's not that powerfull of Okami.

How about CAT? That one seems quite complete, though maybe a bit too
hard to set up to my taste.

Cheers,
Jef

With Cat I've the same prob as with Newswatch. I can't connect to my ISP.
And yes it's rather hard to set up.
I've tried Cat out a few times (with another ISP) but IMHO it can't
replace Okami yet.

Hi Martin,

That's a real shame.

Thanks for your and Saka's efforts in trying to get it back up again.
Maybe in a few month's time there will be another sysadmin and it'll
get sorted out.

## 16. TeraDesk 3.87 released

Newsgroup: comp.sys.atari.st
Date: 2007-01-02 17:36:48 UTC
From: vdjole@EUnet.yu
Message-ID: <ene57e$ffg$1@news.eunet.yu>
Source record: 6580

Version 3.87 of TeraDesk open-source desktop for the 16-bit and 32-bit lines of Atari computers is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

This release brings several small enhancements, a number of bug fixes and an improved hypertext manual.

See the history file for more information.

Have fun.

## 17. DarkForce! December 2006 winners!

Newsgroup: comp.sys.atari.st
Date: 2007-01-02 21:15:21 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2007.01.02.21.15.21.725604@charter.net>
Source record: 6581

Well, nothing like December and that Christmas cheer, eh? Here is the list of our winners for this month:

1. 3 month subscription to ST Magazine - Callaghan!

2. Mega STe motherboard - Doc Clu!

3. Guderian (8bit game) - Jelle!

Next months prizes include the following:

1. 3 month subscription to ST Magazine

2. (another) Mega STe motherboard!

Congratulations to our winners, and good luck to all those who call this month! :)

PS I'd better explain Doc Clu's winning strategy - he was the only one who registed more than once for his prize - in fact, he registered multiple times. The program I use to pick winners randomly picks from a list - a caller is obviously going to have better chances the more their name appears on that list. So the more you call and register.... :D

aaahhhhhhhh!!!! so thats how i have a better chance at winning ,,,,
i'm thrilled , my name is callaghan and i have won a three
month subscription!!!!!! yahoo!!!!

i didn't really register multiple times for the simple
sake of not defeating the odds of a fair draw , but
now knowing the tactics ,
i will have to play and register more often...

thanks
callaghan

ps. how do i get my prize????

Simply come by my house and pick it up... <lol!>

Just kidding, I have an arrangement with Nick at 16/32 Systems. I forward the payment and winners address (you do have the correct address in your use parameters, right?), then he will mail it directly to you.

Congrats! :D

PS If you're still in the hunt for a Mega STe motherboard, don't forget about *this* months prizes - it includes another one!

Well, it is all about BBS participation. Get on once a day, check the
messages, post something, and register for a prize that day. Repeat the cycle
the next day.

You get more chances of winning, and the BBS gets a active message base. :)

As several typing and formatting errors were found in the hypertext manual
after the release of this version, files at the home page of TeraDesk
have been updated and now contain the corrected manual.

There were no changes to the program itself.

Sorry for the inconvenience.

No, I meant my AMIGA is outfitted with a 'Cherry' Brand Keyboard, my
favourite Keyboards also going with PC.

AMIGA Keyboard is DIN-Norm, AFAIK. Like the older Keyboardconnector of
IBM-PC, before PS/2-Norm.
My TT is with the standard TT-Keyboard, not my favourite type (gum),
but fully cleaned and in proper working order.

I use more my PC Keyboard as you can see :-)....

I think an IBM-PC Keyboard is the easier way for the TT. I heard about
PS/2 to TT adapter, Mouse and Keyboard.

Best Regards,

Daniel Mandic

## 26. Ethernet and the Mega STE

Newsgroup: comp.sys.atari.st
Date: 2007-01-04 13:55:16 UTC
From: TJ <TJ@invalid.invalid>
Message-ID: <459cfa49$0$4878$88260bb3@free.teranews.com>
Source record: 6590

I just started receiving broadband Internet service through a deal just too good to pass up, but it also means that I've canceled my dialup account. I've been using my Mega STE to access Usenet from time to time, but now that won't be possible unless I can hook up with an Ethernet connection. I've been using versions of Sting and Newsie that I installed years ago, with TOS 2.06 and ICD hard drive software. The STE's internal HD is long gone, but I have two Syquest 200MB removable drives instead. I'd really rather not get involved in installing different HD software, if possible. But, if it's necessary I would at least consider the idea.

In truth, there's nothing Internet-involved that I can do with the STE that I can't do as well or better with my Linux or Windows PCs, but I hate the idea of turning the old girl completely out to pasture just yet. What's available these days to get me back on the Internet with my STE?

Hi TJ,

There's also the 'free' dialup providers to consider. All you pay for is
the telephone call.

Another thing that might be an option, your broadband account may come with
a free dialup service.

Also, my host provider which has my website provides free IPv6 dialup to
it's customers.

Alison

My new provider is a small fixed wireless one-man company, providing
broadband to a rural area where availability has heretofore been spotty.
He doesn't provide dial-up, or newsgroups, as yet. Looking on Google,
there doesn't look like there's many free dial-up providers left but
NetZero. They say I would need to download software, and I don't think
they support Atari, either 8 or 16 bit. Or am I wrong there?

There are a few options. I have a couple of EtherNecs one I built myself,
and one Lyndon built. These were being sold by "Fuji_Man" on ebay recently.
Try sending him a message via e-bay to see if he has any in stock. You can
use those with Sting and Newsie. If you want to make your own all the info
is here:-

http://home.arcor.de/thomas.redelberger/prj/atari/etherne/index.htm

Pictures of mine are here :-

http://www.dwade.freeserve.co.uk/atari/main.html

If you have an ASCI port there is also info on using that there.

If you have a separate SCSI adaptor you could try a Dynaport or Falleron. I
am not sure if these will work with the Mega STE SCSI adaptor. You would
need HD Driver for those.

Lastly if you want to wait a little Lyndon is producing a combined USB and
Ethernet interface. Info here :-

http://hardware.atari.org/netusbee/netus.htm

check out the news links for up to date info

## 31. [ANN] Bugfixes for DGEM : 1.0B

Newsgroup: comp.sys.atari.st
Date: 2007-01-04 23:26:46 UTC
From: Pierre TON-THAT <geek@atarians.com>
Message-ID: <459d8d35$0$21143$7a628cd7@news.club-internet.fr>
Source record: 6595

Bonsoir :)

Download on my homepage or directly in http://rajah.atari.org/files/
-> dgem10b.zip (1.8 MB) or
-> dfix10b.zip (150 KB) if you already have the 1.0 version

- bugfixes:
- crash if poison cloud on monster
- objects thrown and spell casts disappeared in the stairs
- dying character disappeared also in the stairs
- redraw problem on characters positions in the party (after loading
a saved game)
- bad text display (memory problem after loading a saved game or
another new game)
- walking did not cost stamina as expected
- memory corruption after cleaning jobs ('boot of speed' on first character)
- more convenient mouse handling for characters positions changes

Merci ï¿½ Jean-Luc CECCOLI :)

Sorry for the inconvenience. Hope it will satisfy you.

Voilï¿½ !

If you do have a Linux machine with net access, you might use that as a
gateway: install a nullmodem cable between the Linux machine and the ST, and
run a PPP or SLIP server on the Linux box, combined with IP routing or NAT.
You won't get ethernet speed that way, but the required hardware is cheap
and you need no new software.

To be more precise, I have one PC up and going at the moment, a
dual-boot setup with Mandriva 2007 Linux and Windows 98SE. I use Linux
for almost all of my Internet activity. I only use Windows for those few
programs that I like to use that don't have Linux counterparts.

I could do as you suggest, but I'm more inclined toward getting the STE
back on the Internet on its own. If I'm going to be feeding it from the
PC, it just seems like I might as well just use the PC in the first place.

You probably can - however, *I* don't know how to, and at the time I needed this, I was running Windows 98, which did not quite have the required routing capabilities.

I my case, I needed to provide both direct UUCP and PPP to the ST - the solution was a small (<50 lines IIRC) shell script on the Unix box that listened on the serial port and provided minimal AT-command emulation. Upon receiving a ATDT command, it would look at the "dialed" number and fork the right server program - the ST would not even notice that there was no modem connected anymore.

On Windows, I would have had to write a C program to achieve this.

I must learn to be more exact. You can use Windows/2000 and XP Pro as dial in servers, should you happen to have a Windows box to hand rather than a Linux box. However you may have issues getting performance out of the ST Com ports. I am not familiar with the Mega STE but you might be OK if it has an has an Apple type serial port (are these called LAN) as these will run faster.

However I am pretty sure the EtherNat is way faster and can go into a router no bother. ....

You would for UUCP, but I think for general networking , i.e. TCP/IP you would be OK. And in this case its all the OP wanted....

I had a MegaST 4 connected with a 33k modem, I don't see why a 56
would'nt work. It should be faster :-) The only thing to take in
consideration is that to achieve maximum speed, you'll need Hsmodem to
speed the serial ports up.

Cheers,
Jef

> HS modem is that software?

Yes. High Speed modem. An AUTO folder program that replaces the serial routines from TOS. Without it, you're stuck at 19k or somesuch. You will find it at any Atari FTP server. I think it comes with a new serial configuration CPX so you would also need Xcontrol. But I may be mistaken. It's been years.

Cheers,
Jef

Just a brief run down, what are the keyboard solutions for the Atari TT/Mega STe when it comes to adapting other "PC" keyboards to work with it?

Not a big fan of Atari keyboards and mine is only partially working with it anyway.

Thanks!

Unless things have changed, he won't be able to get higher speeds without
changing some things:

1. Faster CPU
2. Hardware mod to the serial port
3. and HSModem

I'd be happy if I'm wrong about this though! :)

## 61. Offering free time for testing

Newsgroup: comp.sys.atari.st
Date: 2007-01-08 14:50:50 UTC
From: Joe Iron <vas.jozsef@karatnet.hu>
Message-ID: <1168267849.491503.323090@38g2000cwa.googlegroups.com>
Source record: 6475

Finally the recasing of my Falcon is completed (actually the floppy
drive still need to be connected) I can offer my free time for testing.
What I currently have:
CT60@95Mhz (with CTClock)
HDDriver 8.13
Spin
NVDI (latest release)
N.Aes/N.Thing (latest releases)
XaAes/Teradesk (latest releases)
Spin! / Metados
MiNT 1-16-3
15GB HDD (2x1GB partitions, the rest is one EXT2 partition)
LG Dual layer DVD writer
Zip drive (100MB, SCSI)
HP 12/24 SCSI DAT (not installed currently)
Jaguar TeamTap (1 piece)
Jaguar controllers (4 pcs)

On request additional software can be installed like BlowUP, etc...
I can test both VGA and RGB output easily.
(EtherNAT / CTPCI have already been ordered)

If required I can test applications on the following computers also:
1040STf
MegaST 4
MegaSTE
TT030
Falcon030 (stock)

## 62. Re: modem for mega st 2

I use to have a 56k connected to my Mega STE4 with HS modem(and then a
TT030). I usually got 48k speed with them on my old isp.

If you have high speed (DSL/Cable) on a pc at home now, you might want
to wait and get an Ethernet adapter.

Hi Ronald!

The A500 and A500plus integrated Keyboard is also exceptional, IMHO.

Kind regards,

Daniel Mandic

## 64. Paskud IDE interface: still waiting !

Newsgroup: comp.sys.atari.st
Date: 2007-01-08 16:45:05 UTC
From: Jerome Mathevet <jerome.mathevet@freeREMOVETHESE.fr>
Message-ID: <b2240fa24e.jerome@jerome/mathevet.free.fr>
Source record: 6480

Hi all,

Just a quick message to warn people about the guy "selling" IDE interfaces at paskud.pl: I sent him the money 3 months ago (in october), I had to wake him up 2 or 3 times during that, all I had as excuse was "I'm very busy, Atari is my hobby, don't have time to test, etc ...". Well, all I can say is that I got the International Bank Account Number real fast ... but nothing in exchange ! You've been warned.

Plus, I asked for a refund via paypal but so far nothing, zilch, nada, rien.

Several people complained here about excessive prices for Atari upgrades. I think they need to consider the quality of the product and the ability of the maker to deliver the goods (you know who they are).

> james

Haven't found many carts for the ST except...

Spectre GCR (Mac Emulator)
VT100 Terminal elmulation cart
Various clock and calendar carts

Well not many. The carts only held 128K and while that would be awesome in the Atari 8 bit world, that wouldn't hold ST Star Raiders. Trust me, I would like to make a ST Star Raiders cart. But the Atari ST cart port is a GREAT way to get information into the ST very quickly. So in summary, bad as a game cart medium, good for a transfer pathway.

199 Polish is roughly $67 US (It's about a 3 to 1 ratio). Add
shipping, and you are probably talking about $75 - 80.

There's a difference between Connect speed, which is dependent on line quality, and modem to computer transfer speed BTW.

To get the best results the OP will need the port speed doubler mod and the hsmodem driver - IIRC that will give him at best 28800 or thereabouts.

I'm not trying to put him down technically speaking, the guy's certainly very
good. What I can't seem to understand is:
1) If you don't have the product, then why ask for the money ? From the web
page, I assumed the cards were "in stock" and he never said otherwise, from
the emails I got from him.
2) If he wasn't sure about the availability or robustness of the cards, why
not send a quick message about it ?

> > got the International Bank Account Number real fast ... but nothing in

If what you're saying is true, maybe I've been overreacting a bit. But still,
I wasn't used to this ...

You are NOT being unreasonable.

Technical achievement or not, if you've paid for it you should have it. Kind of ruins the buying experience too when you're looking forward to something and are excited about it.

Last few 1.44 kits and PeST adapter for sale + Few other bits and bobs
listed, proceeds goto future developments.

http://stores.ebay.co.uk/exxos-surplus-electronics

Keep checking as listed items do change.

www.cps-electronics.co.uk is now closed and no longer trading. All
remaining sales are being slowly listed on EBay.

BTW, I am changing ISP this month, I will no longer have access to this
group. If anyone knows of any free newsgroup servers then please let me
know.

Cheers,
Chris

Aly,

I waited for almost a full year after paying to get my ct63 :)

Which makes me either patient or stupid :) (or both ;)

P.S. I hope I get one of those last PeSTs :)

## 86. closure of cps electronics, relocating..

Newsgroup: comp.sys.atari.st
Date: 2007-01-12 17:52:03 UTC
From: exxos <exxos@home.co.uk>
Message-ID: <9ZSdnRBalv82VzrYRVnyjAA@pipex.net>
Source record: 6400

Hi all,

As the Founder of CPS Electronics I have closed the biz as of 2007. As such
I am selling stuff on Ebay under
http://stores.ebay.co.uk/exxos-surplus-electronics
I keep listing items so check back. Theres a load of stuff not listen yet.
Drop me a line if you like.

As one of the developers for PeST all information is no longer online via
cps-electronics website. Remaining PeST's are currently being sold on Ebay.
I have setup a website http://pest.atari.org/ Which will list sales
distributors and info(when I get around to updating it).

I have setup a new website www.future-technologies.co.uk though at this time
it is unknown what will be placed there. Currently you can view a about me
page at
http://www.future-technologies.co.uk/video/

Other files of interest are slowly being ported over to stos.atari.st
website. Documents such as my 1.44 controller will all vanish of my pipex
account at the end of this month. Currently I do not know where past
projects will be uploaded to. I will imagine such items will be placed on
the new PeST site in the future. I will try and retain as much info and
pages as possible

Thats all for now, happey new year to you all!

Chris

## 87. Re: modem for mega st 2

Hi Derryck,

DC>There's a difference between Connect speed, which is dependent on line
DC>quality, and modem to computer transfer speed BTW.
that's it.

And IIRC the transfer speed should be about twice the connect speed,
because of the modem's buffer. And a fast modem waiting for a slow
computer (my TT, too) means waisting time (and therefore, money).

There is a small hardware modification to speed up the ST's (1040,
e.g.) serial port to 38.400 bps (no fallback, problems with fax
possible).

Bye,

Peter

Atari PC-1 Computer System. This is Atari's first attempt at the IBM clone market. The IBM clone is in an Atari Mega ST case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2" ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled GEM Operating system, and manuals that are photocopied. Serial Number is #0007 so besides being very rare it's one of the First! Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the box with paperwork. For both computer and monitor $250.00

Pictures of the unit are on the site listed below.

Classic Computer and Video Game items for Sale/Trade

Hello everyone,

I just put up three auctions on ebay which might be of interest to some of you. The auctions are for a minty Mega STE with 4mb of ram and a 40mb harddrive, a copy of Noator v3.1 (with 3.21 disks) complete with a Unitor 2 midi expander, and a beautiful 1040STFM.

All of these items are shipping from Ottawa, Ontario, Canada. I have sold a few other pieces of Atari gear over the last year, and they all went without a hitch. Here are the auctions...

Atari Mega STE 4:
http://cgi.ebay.ca/ws/eBayISAPI.dll?ViewItem&ih=011&sspagename=STRK%3AMESE%3AIT&viewitem=&item=320071959132&rd=1&rd=1

Notator v3.1 (with v3.2 disks) complete with a Unitor 2 midi expander:
http://cgi.ebay.ca/ws/eBayISAPI.dll?ViewItem&ih=011&sspagename=STRK%3AMESE%3AIT&viewitem=&item=320071969455&rd=1&rd=1

Atari 1040STFM:
http://cgi.ebay.ca/ws/eBayISAPI.dll?ViewItem&ih=011&sspagename=STRK%3AMESE%3AIT&viewitem=&item=320071963016&rd=1&rd=1

Thanks for your time!

- Peter

FamilyNet International Newsgate

Hi all, I'm trying to get a Daynaport on the ethernet as detailed at...

http://www.anodynesoftware.com/ethernet/main.htm

Ok, how EXACTLY doies this work?

I've tinkered with HD Driver 7.6 to 8.1 and only 8.1 even sees it out there on the SCSI bus. Mind you 8.1 is only a demo, and for only $35 I can upgrade to this edition. Not bad.

But what exactly would I accomplish if I did upgrade? There isn't anything that the demo can even hint of doing with the Daynaport.

Do you just format your system with HD Driver 8+... and then hope the STINg drivers they have on the Androdyne site will pick up the Daynaport from there?

Can STing handle PPP, PPPoe, or DHCP connections?

I know there are people on the ethernet using these Daynaports, so please chime in!

You need a SCSI adaptor that does SCSI passthru. Link97 or 98 or TT or
Falcon built in.
You need to configure sting to load the Anodyne driver.

> I've tinkered with HD Driver 7.6 to 8.1 and only 8.1 even sees it out
there on
> the SCSI bus. Mind you 8.1 is only a demo, and for only $35 I can upgrade

If you have the 0.71 drivers any version of HD Driver should be O.K.

> But what exactly would I accomplish if I did upgrade? There isn't anything
that
> the demo can even hint of doing with the Daynaport.

Are you trying to boot from a floppy. If so this I have had trouble with
this.

>
> Do you just format your system with HD Driver 8+... and then hope the
STINg
> drivers they have on the Androdyne site will pick up the Daynaport from
there?
>

You should not need to format. Just install the driver. My drivers were
partioned with the Atari utilities
You then need to set up the sting stuff. I seem to recall some of the
entries are case sensitive.
I also seem to recall some settings need to be set via the sting CPX.

> Can STing handle PPP, PPPoe, or DHCP connections?
>

Sting can do PPP over serial. Other wise it only does plain ethernet with
static IP address. Most home routers can cater for this.

> I know there are people on the ethernet using these Daynaports, so please
chime
> in!
>

Yes, but it is a but fiddley to get going, especially if you have not used
Sting before.
I know http://www.dwade.freeserve.co.uk/atari/main.html is about EtherNec
but some of the notes on STING might be helpfull...

You can set *. mask in Set program types... to stand for TOS-type programs,
if that is what you want.

If you only have to manage few files without extensions, you can also
set each particular filename (complete name), instead of more general
masks with wildcards in Set program types...

Even if you do not assign the filename or filetype as a program type,
you can still run the file as a program by selecting Run in the dialog
that opens when trying to open unassigned file(type)s.

cu;

Do you know I can't remember if Win98 supports dial in networking. It
certainly does not support connection sharing. You need something like
Wingate.... If you have broadband get a router and ethernet for the TT.
Either an EtherNec or a Falleron/Anodyne SCSI/Ethernet adaptor....

If you can get broadband...

You could look for a Reibl or PAM VME ethernet card. I have a PAM card
in my TT and it works pretty well with MiNT (I ran my web/mail/ftp
server off it for quite a while).

A better option would be to wait for the NetUSBee cartridge which is
coming out soon (see http://hardware.atari.org). This is backwards
compatible with the EtherNec hardware and as such already has working
drivers for TOS and MiNT (I don't know about MagiC, as I don't have it
and so haven't tried it).

Thanks for all the help. So far I have managed to get the system to load noticing that the Daynaport is out there at startup, and I am able to ping the router and it successfully sends the packets, though pinging doesn't seem to work for any other locations. Kinda at a stand still at the moment.

Part of me wonders why I can't ping outside of the router.

Another part wonders if I have STing correctly configured for CAB.

Someday I'll try Highwire when I feel ready to pony up for NVDI 4 and Speedo GDOS. :)

Thanks. I have a lot of files without extension since I installed MiNT
with ext2 partition full of 'unix' stuff. I tried the "*." mask but it
didn't work. Maybe I did something wrong. I'll try it again and let you
know the result. Selecting the program type in a dialog every time is
very boring (0th click: click on the program, 1st clcik: I want to run
it, 2nd click: It is a TOS type of application, 3rd click: OK = 4
clicks)

Yeah, it's a fantastic little device, and works on anything with a cart
port. You could write Lyndon an email and ask him for ballpark prices
and availability date.

Whats in your route.tab. I can't remember what should be in it for a
Dynaport, something like:-

192.168.1.0 255.255.255.0 EtherNet 0.0.0.0
0.0.0.0 0.0.0.0 EtherNet
192.168.1.64

The Ethernet possibly needs to be something else...

The Daynaport SCSI/Link (& I think the Fallaron) needs arbitration,
which AFAIK the Mega's adapter doesn't provide :-(. To run the
SCSI/Link off an ACSI port, you need a Link96/97 to provide arbitration,
and something else on the same port to provide termination power to
power the Link96/97 ... not very useful unless you just happen to have
the hardware ...

The following URL will give you some more info:

Source record: 6427

FamilyNet International Newsgate

What was it, a year or so ago Rodolphe, the creator of the CT60 (the 68060 upgrade board for the Falcon) asked for a list of interested people in getting a 68060 upgrade for the TT030. He asked for 50 users, and got about 25 that would be willing to buy this upgrade. And so he turned his attention to the Falcon.

I'm a big fan of the TT030 and would love to show that if nothing else, there are 50 TT030 users out there that would love to see this too.

Please, if interested, sign up and tell other friends that have TT030 Atari computers about this list. Know that IF we could convince Rodolphe to make this upgrade that it would take some time to develop, so you have plenty of time to save up for the upgrade if you needed to. :)

Thanks for your time, and spread the word! Let's show that TT030 users are still alive and well out there.

The list...

That is not true (Win98SE), see there:
http://www.annoyances.org/exec/show/ics_98

However, I seem to recall reading that Windows insists on having 192.168.0.1
as IP on the network to make Internet connection sharing work.

Hi Greg!

You can count me in :), but I would rather like to see a fast FAST-RAM extension (as well...), for 16/32/64 MB or max. 256MB SDRAM (when possible),
or SIMM Sockets if not other possible.

The speed with the std. TT is good for me.
I guess I will have some troubles when using a 68060. E.g. MIDI Timing, Cubase, X-Audio (Sample Editor) and other various MIDI Utils, or?

Best Regards,

Daniel Mandic

> possible),
> or SIMM Sockets if not other possible.

A FAST-RAM extension is a good idea and will be a good adendum to a 060
boad. A friend and i have plenty of spare parts for TTs. We hope, not all
dead. But very few FAST-RAM cards. With a 060 daugther board and a
FAST-RAM card we can awake some more.

Best Regards,
Michael Bernstein

## 123. Expander software for st?

Daniel, if it is Rodolphe that does one, you can count on high quality results. He set the CT60 for the Falcon up so that with a flip of a couple of switches on the front panel of my recased Falcon, (with a reboot) I can restore it to completely original Falcon 030 mode.

Best single thing that ever happened to my Falcon. :)

I think that in such configuration the "*." indeed will not work- it will
be valid only for those names that terminate with a dot ("*." works in
single-TOS on FAT filesystem, though).

Maybe something could be done by using the any-character-but... mask,
but I am not sure. I will have to think about it (any suggestions for a
solution? Is it possible, and wise, in ext2 filesystem to distinguish
a program at all by its name only? Should one examine whether 'execute'
rights exist?)

I agree.

How about specifying each particular filename in the Program types dialog.
How many is 'a lot of files without extension'?

How about the "*" mask? It covers everything under Linux. Or is that too
general for this situation?

Umm, you just use switches and I ran wires to the front of my case. You use the jumpers on the CT60 that allow you to disable CT60 mode, as well as disabling the motherboard mods, reset, etc...

I've got a total of 4 switches on the front of my Wizztronics Rack case:

Power on/off (rocker)
CT60 enable/disable (toggle)
Motherboard mod enable/disable (toggle)
Reset (pushbutton)

"*" will then try to run everything as if it was a TOS program. Even
text files, etc. Not a good solution.

Unfortunately I'm not a Linux guru, but execute right raises one more
problem: currently you can start MiNT/XaAes/Teradesk without loggin in.

>
> >Selecting the program type in a dialog every time is
> >very boring (0th click: click on the program, 1st clcik: I want to run

In a Linux-like enviroment almost no executable has extension

>
> cu;

Two more thing I recognized:
- There are files which has no name, only extension (".something").
These files are not displayed in teradesk.
- It seems to me, that it doesn't follow the links (special type of
files in MiNT), but I'm not sure it is Teradesk

Thanks,
Jozsi

## 134. It is Me/MiNT again (login)

Hi Michael!

Do you mean a Fast-RAM card for the 060-CPU, or a Fast-RAM for the
CT060 and a FAST-RAM card for the original TT030 Atari?

I would like to play around with 'X-Audio for accelerated Atari's'.
It's a Sample Editor program.
My 2/4MB TT is nice, but 4MB is not much for sample-editing.
Well, I could exchange the 4x1MB to 4x4MB, for a total of 16MB
Fast-RAM, but as far I saw now, is the RAM Card I have, not the fastest
and I remember good the times of my AMIGA, where 15MB/sec or 20MB/sec
Fast-RAM speed, made exactly that difference you felt, when using the
machine. Approximately a quarter faster then.

I think the 32MHz 030 can make good use of X-Audio, greater/faster apps
I do not need.
I have as well a 1GHz P3 which makes the greater tasks,
e.g. TIFF pictures (<200MB), Multitasking NT for Internet Computing etc.
So, no need for a 060 :)

For my first instance app on the ATARI, a ST 8/16MHz with Blitter would
fit as well.
But the feeling in Cubase 3.x, with a TT and NVDI on, is absolutely
PRO, IMHO. (CUE and REWIND for example)
MIDI Timing seems also to be similar to a ST (backslowing.... PC is
stumbling forward), but I have to check it one time, with a std.
1040STf.

Kind Regards,

Daniel Mandic

Do you want to start XaAES from the console instead? Don't get the
question, really. There is an option for this in EasyMiNT afaik.

I think EPSS works on the STE/MSTE/TT. It plays 8-bit samples and
installs as a MIDI interface in Cubase iirc.

... or buy something for 50eur on ebay and get half-decent results.

Daniel, the CT60 has its own FastRAM. The memory bandwidth is insane (100Mhz bus, 100Mhz CPU). Once you get used to that speed, you'll never want to go back to the 030. Trust me.

Generally, the CT60 is very compatible, even with badly written stuff such as Cubase.

The idiot Registrar screwed up the renewal. I've sent several e-mails
to support and they have not fixed the issue. I have 3 domains that I
renewed but are stuck in limbo.

Yes. This setup allows me total flexibility, as to how I want my Falcon to bootup. I don't have to open the case, I don't have to reach around behind the machine to switch anything, etc,...

> P.S.: What's about the MIDI compatibility, going with CT060 and TT!?

I'm afraid I'm not a big MIDI user so someone else with more expertise will have to answer this question. It's my general understanding though, that MIDI software gets along with the CT60 very well.

Hi Daniel,

> Do you mean a Fast-RAM card for the 060-CPU, or a Fast-RAM for the
> CT060 and a FAST-RAM card for the original TT030 Atari?

We had first to check our spare parts and look, how much motherboards are
ok. But maybe we have not enough Fast-RAM for the original TT030.

Maybe we have also not enough daughterboards with 68030 CPU. So if
someone will build a 68060 daughterboard, a Fast-RAM card for the 060
card is also a good idea. If someone build a 060 card and i decide to buy one, i
think i would also like to by a Fast-RAM because i am afraid i have no spare
Fast-RAM, but enough free motherboards for the 060 card. So i would like
to use some of the incomplete TTs for such a upgrade.

Best regards,
Michael Bernstein

Well, I guess one could alter the startup stuff in MINT.CNF, but I've
had it like that since I installed easymint.
However, since XaAES loads kernel modules it needs root access, which
means you'll have to use something like Sudo to start it (works for me)

And as a result nobody can find the dev subdomain :-P It's ok though, I haven't had any time recently to work on it.

Thanks,
Mark

Sudo is a console application, I don't know if it's included in a
typical easymint distribution, but it should be.

I enabled the 'login' option in easymint during installation. Don't
know how to change that later on, probably trivial for someone who
knows how, but I don't, sorry.

Somebody help me, please!. I'm installing MiNT by hand (I want to know
how my system works, what to change if anything is wrong).
Is there a detailed MiNT documentation similar to the ones that
available for different Linux distributions? What is the closest Linux
distribution to MiNT?

Hi Michael!

Obviously I have spent too much time with AMIGA Turbocards, because I
am totally confused now :-)

You mean the CT060 can run on the TT Motherboard, without
changing/removing the TT FAST-RAM Card?
But, can a CT060 run with its own Memory (TT FAST-RAM Card not plugged
in, on the TT Board), just a Sidecar on the CT060 Board with RAM,
SDRAM...?

AMIGA could do so (using old RAM with higher CPU's), but with
restrictions to MHz (~8MHz) speed, and 16bit (24bit addressing) wide,
of course.
Well, the TT Fast-RAM is at least 16MHz and 32bit, but with a CT060
inside, it would stay at 16MHz, so far I understand.

By the way, even the 32bit AMIGA's (3000, 4000), had their own 32bit RAM
on various Turbocards. The std. onboard RAM was usable as well, slower
though, but addressable and already 32bit wide (A2000 was 16bit wide, my
favourite AMIGA). Even 16bit Cards (Zorro-II Cards), e.g. Memory Cards,
are addressed rightly.
Then (when having such an exotic environment), every RAM gets an
Priority. Fastest RAM (local RAM on the Turbocard) the lowest (-5, or
so for the Sideboard-RAM, 0 for the onboard 32bit RAM, +5 for the 16bit
RAM on various Z2 cards and +10 priority for the Chip-RAM :-) etc etc.)

Can you point me please to a web-site eventually, where the CT060 and
other TT specific questions are clearing up a bit for me?

Best Regards,

Daniel Mandic

Hi Daniel,

> Obviously I have spent too much time with AMIGA Turbocards, because I
> am totally confused now :-)

Or i have some confusing ideas. I have np knowledge about the CT0060 and i am working as a software engineer but not as a hardware engineer.

> You mean the CT060 can run on the TT Motherboard, without
> changing/removing the TT FAST-RAM Card?

I expect, that a CT060 for a TT will also run without changing/removing the TT FAST-RAM Card. Any CPU card put in the socket for the daughterr board shouldbe able to access all parts on the mainboard. So i see no reason why not access TT FAST-RAM. As far as i remember, the mainboard is made for 16 MHz and the daughterboard with th 030 CPU acts like a 32 MHz hardware accelerator similar to some 16 MHz cards for old STs,

> But, can a CT060 run with its own Memory (TT FAST-RAM Card not plugged
> in, on the TT Board), just a Sidecar on the CT060 Board with RAM,
> SDRAM...?

Has the CT060 a socket for fast RAM? Because i have no Falcon, i did not took some closer look to the CT060.

> Can you point me please to a web-site eventually, where the CT060 and
> other TT specific questions are clearing up a bit for me?

I have no links to informations about CT060 or TT. Maybe someone else have some useful hints.

Best Regards
Michael Bernstein

Hi David,

> I might be up for one of these, depending on cost...

One of the TTs with 030 CPU if we can set up enough? I try to remember your interest if we have some assemled. One of the problems is ny friend which has most of the spare parts, but less time than ideas what to do with his free time. There are Atari, german MausNet, Citroen, ... We have the parts a few years, but nothing happend from him. After problems with set up a PAK (Atari hardware guru Michael Ruge give up), i took a closer look at this parts. He has promised he has next month a little bit time left to start with some boards.

Best regards
Michael Bernstein

How about http://www.czuba-tech.com/ -> the CT60 creator's web site. From there, I believe there are other links to CT60-related web sites, in addition to lots of info on the site itself.

Here's the info as best I can remember:

68060 anywhere from 50 to ~100MHz, depending on revision of CPU you can get.

Variable clock rate by either swapping out clock chip or using CTCM module.

Also, yes, the CT60 has its own fast-RAM slot. It takes 100/133MHz SDRAM.

25MHz bus accelerator (for Falcon - no idea about TT, and only on CT60, not CT63).

Replaces Atari power supply, power and reset switches, power and HD lights, etc. with PC-compatible versions.

TOS 4.04 and CT60 BIOS in updatable FlashRAM, which gets copied into SDRAM at bootup for maximum speed.

A new card slot for addons (i.e. SuperVidel graphics card, EtherNAT networking and USB card, etc.)

Can be turned off by connecting a switch for 100% backwards compatibility.

I think that's about it. Anyway, I'm not sure how much of this would be usable on a TT, should R. Czuba make a TT version or adapter for the existing one. But it is a very nice addition for my Falcon! I can't imagine going back! The only thing that would make it better would be a SuperVidel graphics card and EtherNAT networking/USB card!

Hope that helps!

In the current CT60 design, the TT-ram would conflict with the FASTram on the CT60 since it's mapped to the same location. Also, wouldn't the TT-ram be quite pointless anyway, since it's so much slower? Also, TOS can't distinguish between "fast" FASTram (on the CT60) and "slow" FASTram (TT-ram), which would complicate things further. Perhaps there could be a point having a small amount of TT-ram for SCSI (not sure, but afaik the SCSI interface in the TT can use TT-ram, unlike the other peripherals?), but certantly not for software applications?

Hi PeP!

I understand. It increases compatibility on software, which actually
runs on TT030 and its 32bit environment.

> TT-ram be quite pointless anyway, since it's so much slower? Also, TOS
> can't distinguish between "fast" FASTram (on the CT60) and "slow"
> FASTram (TT-ram), which would complicate things further. Perhaps there

Hmmm, I remember timing problems with an A4000 Turbocard. Sideboard
with 40MHz RAM speed for a 040/40, had timing incompatibilities with the
onboard (25MHz) IDE-Controller.
When disabling the fast FAST RAM and running
assynchron 40 to 25MHz onboard AMIGA 32bit-RAM, every thing ran o.k.

I hope this case will be developed as good as possible and I am going
to buy/invest into a CT060 for the TT030. OR!, a SCSI (Fast-SCSI-II)
Host on the CT060, like on my last 'Blizzard 2060' Turbocard (the 100%
solution for reliable SCSI operation, IMHO). IDE would be O.K as well
and maybe the better choice, due to unavailability of HD's, normal HD's
;-). Not 15000UPM and such. Too expensive etc. (Compact Flash!? etc
etc.)

I remember good the A2000 060 Card I have had. It was more compatible
than other 040 cards and some worsened designed 030 Turbocards. Only
beaten by the mighty Commodore 'A2630', for the A2000 series. The
'A2630' could be turned off an on, just holding "left Shift", or so.....
which was seldom the case ;-), I think.

Some testing with MIDI Stuff and CT060, I would appreciate to hear
about....

Hi Michael!

The Link to Czuba Tech opened up my thoughts. Very good work, what I
can see in the first sights. 060 BUS Slot... and decent :) Fast-RAM
Speed.

By the way, do you own a CT60, or do you also looking to order one, one
for the TT?

Best Regards,

Daniel Mandic

Nope.

> Should one examine whether 'execute' rights exist?)

That is exactly what other desktops do. In Thing you can disable
this in case you don't need it (it takes some time to introspect all
files in larger folders).

Even cooler feature would be to run the unix utility called 'file' to
get either MIME type or the textual file type description and be
able to map apps based on some regular expression. But that
is probably not a feature to the minimal desktop Teradesk
currently is.

Best Regards

STanda

## 168. News: HDDRIVER 8.2

Newsgroup: comp.sys.atari.st
Date: 2007-01-28 08:33:44 UTC
From: Uwe Seimet <Uwe.Seimet@seimet.de>
Message-ID: <5235f8F1mfmftU1@mid.individual.net>
Source record: 6382

There is a new version of HDDRIVER available, with the most prominent change the support of IDE drives with a capacity of up to 2048 GByte (LBA-48). (Up to now only 128 GByte were supported.) For SCSI drives there is no change, i.e. drives up to 8192 GByte are supported.

A list of changes in the latest version 8.2 and a new demo version is available on http://www.seimet.de/hddriver_english.html.

> (the 68060
> upgrade board for the Falcon) asked for a list of interested people in
> getting a 68060 upgrade for the TT030. He asked for 50 users, and got
> about 25 that would be willing to buy this upgrade. And so he turned
> his attention to the Falcon.

Are you sure Rodolphe asked for such a list? Can you tell where did you
read this information, please? (maybe on newsgroups?)

Here is what I found on fr.comp.sys.atari, and it concerned the CTLink,
not a CT060 for TT :

=====

The CTlink project was started a long time ago now...
After several months thinking I will finish the design (stills only the
CPLD
to code and the PCB routing around this CPLD), I realized three thru
things
:
1 - The power of MSTE, TT & standard F030 is too low to allow to really
use
Ethernet 100Mbits... Even 10Mbits and USB (12Mbits) will dramatically
decrease the performance of these machines.
2 - Pre-orders are only 16 cards for MSTE, 25 for TT and 61 for F030. For
the first 41, a second card is needed to adapt to VME. 41 is not enough
to
get a good price. And 61 on falcon is not terrible.
3 - I do not find motivation to finish this design (and win a bit money
is
not one).
4 - I need more time for some other projects I consider more important
and
really more motivating (CTPCI & new motherboard).

So, I decided to cancel the CTLink project.
The schematics and notes will be put into a ZIP file and everybody will
be
able to download.
There is no copyrights on this and if one of you want to finish I will be

happy for atari communauty.

=====

Stephane

Op 2007-01-16, Joe Iron schreef <vas.jozsef@karatnet.hu>:
> Is there a way to tell Teradesk that files without extension need to be
> handled as "TOS" files?
>

Most of the time when I'm running MiNT unix-like stuff on my ext2 partition,
I'm doing this in a TOSWIN2 window, from a bash shell.

If I really want to run it by clicking on an icon in Teradesk,
I just make a copy or symbolic link.
For example I have a copy of shutdown (from the sparemint "oldstuff" rpm
package) renamed to shutdown.tos that I use to shutdown my MiNT system in
ARAnym. This is still the shutdown method that works best for me. But that's
another subject.

I see, with IDE drives, you stopped at maximum XHDI can handle (32
bits). Have you considered extending XHDI with new functions to fully
support 48 bit addressing? (that would give us max of 131 072 000 GB :))

Ask me this question again as soon as Atari users want to add drives
larger than 2048 GB to their Atari :-).

Hi Adam,

AK>There already are 1TB disks, I think we'll se 4TB this year. I'm
AK>thinking about buing one :-)
my first harddisk was a Megafile 30, my current one is an IBM DCAS
with 4 GB, and I'm pretty sure I will never need a larger drive as
long as working with my TT.

I really do laugh when looking ad the ads for Windows Vista,
especially when regarding the hardware requirements...

So long,

Und TTschï¿½

How do you recognize an executable file in an unfamiliar directory?

> - There are files which has no name, only extension (".something").
>These files are not displayed in teradesk.

This is on purpose, such files are supposed to be invisible in the unix
world. However, you can set 'show hidden' in Set mask... dialog and then
those files should be visible.

> - It seems to me, that it doesn't follow the links (special type of
>files in MiNT), but I'm not sure it is Teradesk

To what situation are you referring? When 'opening' objects, TeraDesk
is supposed to always follow the links. However, in file operations
like copy, move, delete... the option to follow the links is set in the
copy-confirmation dialog, and is in effect only for the operation currently
being executed. A similar option exists when a dialog is opened in order
to place a desktop icon.

There is no need for formatting any drive in order to use it for the
Atari. Partitioning is always sufficient. One only has to format a drive
if it has bad sectors.

Nowadays isn't really bad having more than 4 MB. 16 MB is fine. But 32
MB is definitively better. I've 4 MB ST-RAM and 64 MB TT-RAM. Maybe
there are some Atari-freaks somewhere out there that really need
more but do we really need 1 TB-RAM? I don't think so.

Currently it's really hard to find a new IDE-HD with less than 40 GB
and I can imagine that someday it'll be impossible to find one with
less than 120 GB but I only know 1 (german) user that really buy a
bigger IDE-HD for his Atari.

>this in case you don't need it (it takes some time to introspect all
>files in larger folders).

This showed to be easy to implement (i.e. to determine whether a file is executable from 'execute' access rights; actual file headers are not investigated), at a cost in program size of less than 100 bytes. Any file with execute rights that does not match anything in 'program types' will be assumed to be a .TTP executable. If everything proves to work correctly, the next release of TeraDesk will have this feature. It will not be switchable, though; making it optional would increase program size and reduce speed disproportionately to the importance of the issue.

>Even cooler feature would be to run the unix utility called 'file' to
>get either MIME type or the textual file type description and be
>able to map apps based on some regular expression. But that
>is probably not a feature to the minimal desktop Teradesk
>currently is.

While far from being able to handle elaborate regular expressions, TeraDesk has certain capabilities for specifying name masks (beyond the simple "*" jokers), that I believe few ever use- or even know of :) I suppose that some improvement can be made there as well, without too much trouble.

A sensible name convention for modern operating systems
would be the names of palaces:

Louvres
Fontainebleau
Versailles
...
Hermitage

The order reflects the increasing need for royal households
through history.
They also all accomodate only 1 king.

## 188. [UtD] February Release of Eureka 2.12

Newsgroup: comp.sys.atari.st
Date: 2007-01-31 07:39:47 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <45c047c3$0$27406$ba4acef3@news.orange.fr>
Source record: 6302

Hi,

The software "Eureka 2.12" is updated on its WEB page. It is a
"2D Graph Describer and 3D Modeller". You will fetch it from :

<http://eureka.atari.org/eurka702.zip>
That is the Complete Common Edition
<http://eureka.atari.org/eurka020.zip>
Is the Complete 68020 Edition
<http://eureka.atari.org/eurkafpu.zip>
Is the Limited FPU Edition
<http://eureka.atari.org/eurklite.zip>
Is the Lite Edition, working on early ST with 720kb floppy
<http://eureka.atari.org/lib_dgem.zip>
Are Dynamic Libraries Extensions for Eureka
<http://eureka.atari.org/tiny045.zip>
Is the OpenGL Extension (requires previous package)

This publication corresponds to 20th anniversary of its
starting developments, that began at first months of 1987.

I wish you big fun with this new STuff !

Best ATARIans regards,

-- François LE COAT
Author of Eureka 2.12

Limit of 120GB was a little bit annoying but 2TB should be fine for
quite some time... :D

any way how you manage to fill even e.g. 120GB harddisc on Atari? All
games and programs for Atari ST and F030 will took only 10% of that
space; do you have 100GB of MP3? :) just joking :)

Working with the VidiST12, I rewrote the driver to capture videos in 16
grey levels. But, as the capture is really time-consuming, I can't perform a
"direct to disk", so I need a lot of RAM to store the images.
With 64Mb, close to 3'30" in 320x240x16 and 14'00" in 160x120x16. It's
not a lot...
With one TB-RAM... a whole film?

The other limitation is that I capture the sound of the video with a
Mega STE (serial link with the TT for synchro) and it only has 4Mb. But
there, sure, I could write a direct to disk capture program.

Guillaume.

But the main question is why not? W2k server is eg via PAE extension
also able to handle more than 4 GB-RAM...

Now you know a second one from Germany. :-)

I once had a 160GB IDE drive for my falcon which I had to give back due to the fact that at that time HDDriver couldn't manage such big hard disks but I do not blame Uwe for that just the other way round :-) I think it is phantastic that he is still supporting the ATARI and we can install current hardware into a computer that is more than 10 years old.

Regards,

Frank

Not only that. :-)

I once converted all my CDs into MP3 (and used my Falcon for that) and
now consider to store the content of these CDs as .wav-files on the
falcon so I don't get any quality loss (except the fact that the DA
converters in the falcon are not the best ones).

Regards,

Frank

I agree 100% :-). Also, although it was only a test, I've had a 160GB
hard drive successfully installed on my TT (with a SCSI-IDE converter).
But I only used one 12 GB partition on it to test multi-DVD support in
my software. I *don't* recommend FAT32 for partitions that big, it's
way too slow (as Uwe says in the HDDRIVER manual).

It is specific to intel/amd CPUs. Yep, you could add some hardware
extension, maybe bank switching like on XL/XE, but it will not work well
in multitasking environment.

I take it that Nick has confirmed the venue then? The main site
suggests it isn't yet.

When I tested the latest version of HDDRIVER I created a FAT32 partition with a size of 380 GB. Partitioning took so long that I thought something was wrong with HDDRIVER. But there was no problem with the driver, it simply took several minutes to create the FAT32 partition. Eventually writing actual data to the partition (with MagiC) was no problem as far as speed was concerned.

Hi;

Can somebody point to a FONT-protocol client program that actually uses
font colour and effects (bold, italic...) data obtained from the
system-wide fontselector? It seems that the few FONT-protocl clients
that I have only use font identification and size.

Thanx in advance;

cu;

Yes, the venue is now confirmed. I said I would announce here and at AA and hoped someone else would do the JagFest forums, if your refereing to the link above I am sure it will be updated in due course, and as more information comes in. I beleive that Gaztee done the posted image, as he is in Canada at the moment he is probably unable to update it right now. Apparently the owners have done a lot of work improving the accomodation and so it the rooms are going to be about £5 more per person per night than before.

Stephen

## 228. Falcon with two 2.5 IDE drives

Newsgroup: comp.sys.atari.st
Date: 2007-02-05 19:01:56 UTC
From: JamesD <jamesdier@yahoo.co.uk>
Message-ID: <1170702116.907118.98400@k78g2000cwa.googlegroups.com>
Source record: 6341

I know that an IDE channel by default can only have two devices
connected to it but can the falcon have 2 ide drives internally with
just a 2.5 ide cable with three connections?

Or as usual there is much more to it.

I know this is possible in the amiga but I have a spare 2.5 inch ide
drive with a cable ready to connect???

## 229. DOITF030

Newsgroup: comp.sys.atari.st
Date: 2007-02-05 19:04:49 UTC

What exactly does *three* connections mean? Fact is that you can connect two IDE/ATAPI drives to the Falcon, as long as you ensure that the cable is not too long. And, of course, one drive must be jumpered as master, the other as slave.

As Uwe says, it's quite straightforward, just use a short cable and
don't forget to configure one drive as master & one as slave. The main
issue is probably finding space within a standard Falcon's case. Of
course if you've recased it this would presumably not be an issue.

Roger

Modern 2.5 inch drives are quite slim compared to the 65 meg disks the
Falcon came with. I would reckon it would not be too hard to modify the
cradle to take 2 drives.

Mark

I've got 2 IDE devices on mine - one is an 80 gig Maxtor hard drive, and
the other is a Lite-On DVD burner... :)

Hi all

Coda schrieb:
> stguild-bbs.dyndns.org => 72.196.129.149 seems like it's down. Maybe
> the dns needs updating?

<=== Cut here ===>
[ragnar@odin ~]$ telnet stguild-bbs.dydns.org
Trying 66.116.125.49...
telnet: connect to address 66.116.125.49: Connection refused
telnet: Unable to connect to remote host: Connection refused
<=== And cut here too ===>

For me, it does not look like a dns problem. I think a firewall is blocking
incomming traffic.

Bye
Bernd

## 235. Re: Falcon with two 2.5 IDE drives

Thanks all, I will try it when I next have the courage to rip open my Falcon again.

The only problem it seems was getting hold of a 2.5 Inch IDE lead that enabled 2 hard drives to be connected at once, hence why i said "3 connectors". Standard 2.5 inch Laptop IDE cables are plentiful but only for one device. I had to get the cable from an Amiga firm.....argh :)

cheers

I reckon that there's a DNS cache issue. Nslookup....

Non-authoritative answer:
Name: stguild-bbs.dyndns.org
Address: 72.196.129.149

66.116.125.49? Is not even on the same network.

comp.sys.atari.8bit,comp.sys.atari.st,rec.games.video.atari,rec.games.video.classic,rec.games.video.marketplace,pdx.forsale

I've just received these Atari Games from an Atari Dealers Warehouse! I've made some adjustments. Some facts were wrong. For instance, Lords of Conflict is Lords of Conquest. Starflight is Starlight and Summer Games is for the 8 bit, not ST. And Ultima II by Sierra is sold.Titles listed below for 8 Bit & ST & available!E-Mail Atari@aracnet.com or call (503)256-9974!

Prices below are for one copy each.

8 bit titles

atari logo; atari, complete in thick silver box $20
decision in the desert; micropose $20
kennedy approach; micropose $20
napolean in russia; datasoft $20
summer games; epyx $20

st titles

auto duel; origin $50
axe of rage; epyx $20
data manager st; time works $20
design ideas; time works $20
down hill challenge; broderbund $20
fleet sreet publishing v.2.0; michtron $20
the fools errand; miles/electronic arts $20
frostbyte; starsoft $20
golden path; firebird $20
gridiron!; bethesda softworks $20
lords of conquest; electronic arts $20
manhunter 2-san francisco; sierra $30
midway battles; tdc $20
no excuses; arcana $20
olympus; olympian software $20
operation: clean streets; broderbund $20
people places & things; time works $20
phantasm; exocet $20
santa paravia and fiumaccio; starsoft $20
the sorcerer of claymorgue castle; keypunch $20
space quest-chapter I-the sarien encounter; sierra $30
starlight; tdi $20
stock market "the game"; starsoft $20
symbols & slogans; time works $20
tank attack; artworx $20
targhan; silmarils $20

zynaps; hewson $20

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

## 246. Atari Video Club

Newsgroup: comp.sys.atari.st
Date: 2007-02-08 17:23:15 UTC
From: Dan Iacovelli <atarivideoclub@yahoo.com>
Message-ID: <1170955395.158950.106350@p10g2000cwp.googlegroups.com>
Source record: 6260
Cross-posted to: rec.games.video.atari,alt.atari-jaguar.discussion,alt.games.lynx,comp.sys.atari.st

Atari Video Club will be holding thier meeting at the Westchester
Public Library in Westchester,IL on 3-18-07 at 2:30pm.
the meeting will be two hours long.
the first hour of the meeting will be a meet and greet,where
I will introduce myself and get to know you.
we will also be discussing the following:

Club matters: future meeting dates, newsletter ideas,meeting ideas

ideas for future club outings: amusement park,flea markets,amusement
places

trade show or swap meet ideas VGS or smaller show

The second half of the meeting will be used for trading and possible
demoing some items.
(please Do not bring stuff for selling,since it's at a library and I
told them no money will be collected I don't to get in trouble)
on the subject of bring stuff to demo please let me know first this
way I can set you up(space is limited)
We should be out of there by 4:30pm
the location of the library is:
10700 Canterbury Street, Westchester, Illinois 60154

I should be there around 2pm to set up and unlike the first time I did
this
I will greet you at the door of the library and direct you.
(incase I get off work at 1:45pm I'll bether around 2:15pm)
here is the url to library :http://www.westchesterpl.org/index.htm
E-mail me if you plan on coming.

Dan Iacovelli

## 247. FS: DaynaPORT SCSI / Link-T Adapter

Just a quick note to let you all know that I'm selling my DaynaPORT SCSI / Link-T Adapter. I've got it on EBay if anyone is interested (Item number: 330086334039). Using the Anodyne drivers this adapter will give you the ability to network (using ethernet) your TT, Falcon, ST or Mega.

Thanks,

Bob

> answering emails to get paswords for this archive, what can i do to
> get into the archive?

Robert Schaffner has taken it all offline and will give no longer support for it. Not sure anymore why it happened, I think it was because someone asked for the key or even the archive (to bypass the password) in a newsgroup or something. Robert didn't like this and (now my very personal opinion) behaved like a little child about it and took it all offline.

So there you go, I'd say no chance to get it, unless you find someone who has DOITF030 on the harddisc and is willing to send it to you. If that's ok with you that is up to you.

Cheers, Ingo =;->

I found it on http://ftp.funet.fi/pub/atari/falcon/doc/, and the
archives there don't seem to need any passwords. At least I could
extract the DOITF030.LZH fine using winrar on windows xp.

This looks like a really outdated version to me. Look at the date. As far as I know, Mr. Schaffner always updated the archives right up to the point when they went offline.

But maybe this archive already is what the OP was looking for, even though it is that old. And God knows about the legal status of that one.

My guess is that this is an authorized version of the archive because if it was not, the author most likely would have had this one removed from the server.

But as I was saying, that's just me guessing.

Cheers, Ingo =;->

Yes it's a very very old one IIRC. Even the one I have is a couple of
years old now (7.3.0).

Coda.

I can't blame Robert he acted this way. Robert has put lots of free time
to get DOITF030 as updated as possible. As far as I know Robert didn't ask
money for the archive. All he wanted was people sended him a kind
mail to ask the key. But it seems this was even too much trouble so ...
If I was in his place I would have done the same.

TTFN,
Martin

Source record: 6270

Hi Martin!

> If I was in his place I would have done the same.

I don't know if you would...
Have you followed this topic back then? How it happened? What exactly happened? My mail was far too simple to describe the actual circumstances.

Unfortunately I haven't seen the offending thread in this forum back then, because the thread got entirely deleted. However, it should be possible to fairly well reconstruct what had happened from another thread in which the shutdown of the forum was announced and users wanted to know why:

Some Falcon user did in fact try to obtain a key from the doit author but didn't get it for reasons that I can only speculate about (commercial use of his Falcons).
Obviously he then tried to contact the author directly, but with no success. That's when he chose to ask in the forum.

Now I don't know if he got a key there or solutions how to get around it, but it seems like he didn't (at least I guess this from one sentence the forum master wrote: "...no punishable act has been committed in the forum..."). Some other user then suggested that the doit site "may be deficient or may no longer be active and just be another dead corpse in the big wide www".

At that point the doit author himself must have written something about his site not being dead. Unfortunately he must have done this in quite an inacceptable and rude manner.

At the same time the doit author also wrote to the forum master directly, threatening with some kind of law suit and wanting the IP addresses of one/some users.

So the entire offending thread got deleted and the forum master also wanted to shut down the whole forum. He could not understand, why this situation could not have been rectified between the two involved persons, especially when you consider that he got contacted very promptly and with a threat, but no such contact has been tried with the "offending" user.

Soon after that, all the Atari related stuff of the doit author disappeared from the net.

Ok, I think this is a rather complete account of what had happened back then. So it wasn't quite as simple as just "asking for a password in a

public forum". It was a bit more complex than that.

By no means did I want to encourage to ask for passwords or cracks or justify such behaviour! Of course I do respect the work of anyone, particularly spare time projects. But if a situation like the above does happen, it is also a matter of how to deal with it...

Hopefully it's a bit clearer now why I wrote what I wrote.

If you happen to speak German you can read the whole discussion thread here:
http://f6.parsimony.net/forum6332/
But the forum is now finally closed (due to other reasons), so you will only find a zipped archive there.

Cheers, Ingo =;->

Ok, well i can give him lots of kisses and any loving he needs but quite frankly i'm sure other people have cracked the archive with freely available zip crackers and kept quiet. Just seems a shame that the DOIT website is now geared towards Macs. Why not charge a few dollars/pounds/euros via paypal for access to the archive, i'd pay!

Is he Sinclap in disguise (remember him!)

Please note that this is a friendly request so i don't want to see any legal threats or solicitor letters through the post... :)

Any (nice) suggestions?

FamilyNet International Newsgate

So you had this working. Please let me know exactly what software you used to get it going.

I have managed to get one JUST like it to work to the point that it can send packets (ping) successfully. No luck getting it to work with Cab 2.7.

I also got mine right away. But some people don't and also don't seem to
get a reason as of why. Then I do not find it too surprising that they
ask about it in a forum...

> I can read German enough to get a picture.

Ok, just a hint to save you lots of time:
Create a new folder, let's call it "Forum". In it, copy x.zip and unzip.
Then create a folder "Forum/messages" and unzip the other 2 zip files
in it. And don't do this on a windows machine. It's about 15000 single
files! Even on fast machines it's going to be horribly slow.

Then open index.htm and the thread is right on the first page almost on
the bottom.

Enjoy ;)

Hello,

I recently bought a Matrix VME card on ebay.
It has "Matrix M128" and "Monograph" written on it.
Unfortunately, it came unboxed, with no manual, and 4 disks that
are labelled as follows :
1- MatScreen Farb-Treiber V1.0 (06.07.90) fï¿½r C32 und C110/128
2- MatGraph M128 SystemDiskette V1.3 Datum: 1.08.92
3- MatGraph MatScreen Systemdiskette V2.0 28.03.91
4- MatGraph MatScreen Systemdiskette V2.1 datum: 04.06.91
Browsing the net, I could find a site which explains how to install
a TC1208DR (what's this?), but as I'm not sure whether my card is
compatible or not, I'm asking here for help - hoping someone will
be able to drive me through this :-/

I got the key for 2 versions of DOIT long ago.
As far as I remember, Mr. Schaffner used an automated process that used
informations the user was to give.
AFAIR again, the way things were explained wasn't that obvious for who
didn't read them thoroughly - or, say it's the way I felt this, and I
remember I thought something like (in french, of course!) :
"Oh! God! one must be very careful when giving the info! One single little
typo, and bye-bye the key!"

Greg,

It's been several years since I had the DaynaPort hooked up to my TT. I
now use an EtherNEC card that I purchased directly from Lyndon Amsdon
about 2 1/2 years ago. All my STING settings are now set up for that
interface although I remember not having to change much (except the
drivers) when I switched over. The only software I'm aware of that
works with the DaynaPort are the drivers from Anodyne Software and STING.

Sorry I can't be of more help.

Bob

I had one of those, but sold it years ago. IIRC this card won't work with
a VGA-monitor, you need a monitor that can handle ECL signals. I didn't
have one so I couldn't test this card. Pretty useless on a TT though,
considering the TT's high resolution mono-mode.

Greetings everyone!

Here are the lucky and the proud winner(s) of the January prize(s) at The DarkForce! BBS:

January 2007
1. ST Magazine - Teklord wins the free 3 mag. subscription

2. Mega STe motherboard- Guitarman61 wins it!

Congratulations to our winner(s)!

---

Also, here is Februarys prize:

February 2007
1. ST Magazine - some lucky Atari caller will win a free 3 magazine subscription.

2. We just had the SuperBowl here in the US, so lets play football! AFL Football that is! The winner of AFL Football this month will pocket a $25.00 cash prize. (please read the docs fully, you must play to win).

Congratulations to our winners, and good luck to this months callers!

:)

Funny, after all those years I don't think I can shut this site
down....
But Jo Even is right, this card is for ECL monitors. The TC1208 is for
VGA ones and produces max 624x832 in 24 bit resolution if I recollect
right (it's been quite a while since I last fired up my TT).

Falcon memory upgrades do not fit into any 1040!
If it is an STE, you can use standard memory of its time and those are
still available on Ebay.
If it is an STF or STFM you run out of luck. You will need soldering and
some hacking of the MMU connections to fit an upgrade to 4MB.
A single RAM chip of 4MB wouldn't help either, you would need to build
an entire access logic to make the ST able to access it.

HTH,
Matthias

Thanks Lonny - but that's the page I was speaking about ;-)
Now, I know :
1- this card only works with ECL monitors,
2- should I own such a monitor, this card would be useless on my TT since
it has better native hi-res mode than the card can offer,
3- I've been had - and... ouch! it hurts! :-(

I seem to remember from past discussions that the LAN port of the Mega STe is indeed compatible with Appletalk networks. Is it suitable for use with modern Macs somehow?

I don't really care about getting the MegaSTe online, but I would be delighted if I could be able to transfer files between it and my Powerbook G4 so I can eliminate floppy disks, CD-Rs etc.
Can this be done without any additional (expensive and elaborate) hardware?

Hallvard

## 285. Video playback on Atari ST(e)

Yes, I know about. Your program is much more complex and is
certainly many work in it.
But it is simple not for machine like ST or STe. I achieved 1.3 fps on
STE at 320x200, and in B/W, what is more slideshow than movie
playback.

Only reading raw bitmaps at 25 fps occupies about 80-90% of machine's
capability. For playing back compressed videos at 320x240 for instance
100MHz CPU may be not enough fast - depending from used codec.

Other thing is memory usage - my player uses not any buffering, so it
can play practically any length on machine with 512KB, without any
stoppings.
I just think about making DVD with some movie in LAV format. There
should fit about 90 minutes of uncompressed video with audio. But it
will require direct sector access instead slow file access to DVD.

## 288. ST Format Issue 3

Message-ID: <45d0df67$0$27398$ba4acef3@news.orange.fr>
Source record: 6203

Yes, you're right with the low speed with MP_STE when decoding AVI/MOV.
But I also have the FLM format from Lexicor that I extended to add
sound.

It is compressed but the decompression is very fast because the images
are stored in the video format 320x200x4 planes and that the decompression
is done directly in the video ram.

Your idea of a DVD in LAV format for STE is good.

But I would like to try to make a FLM from one of your videos and see
two things:
- does the compression give the opportunity to store more than 90
minutes onto your DVD
- does the uncompression allow the 25 fps?

Guillaume.

Doc,
I seem to rember it was a little fiddley to set up. I used HDDRIVER7.9,
V0.70 of the anodyne driver ( found the problem with ARP), and the latest
version of Sting. I have not tried later versions of HDDRIVER. A couple of
things to note:-

1) I could not get this to work when booting HDDRIVER from a floppy. It had
to be installed on the gard drive.
2) I could not get it to work with any other SCSI software, but possiby
because of (1) above.
3) you need to manually configure IP mask, gateway etc....

If you are still having trouble I'll post detailed config info...

Dave.

Come to think of it, my Mac doesn't even have serial ports. It has a
built-in modem, but the connector for that is just for the phone
line.
Looks like I either need a networking card of some sort, or abandon
the idea and rely on floppy disks and/or CD-/DVD-Rs for transferring
files between the computers.

Well, I had similar thoughts about compression. Tried very short
clip in Cyberpaint - it's SEQ format which is fast. But it compressed
very little, probably because it was random dithered. That format is
of course not for longer animations, and as I saw it first depacks,
then plays.
Maybe some RLL based algorithm can be enough fast, at price of lower
compression. Usage of move.l (a0),(a1)+ is mandatory :-) .
Some anims were very good RAR-able, so RLL should compress them at
least to some 40-50% of length.
I will see it, and you may write me e-mail (link on site), if need
some help about fileformat (what is very simple at moment, with SIGN
and framecount only).
Has your FLM format individual palette for each frame? I ask it
because looked to Aegis Animator's format (forgot extension), but
there wrote that it has only 1 palette for whole anim.

I can't wait for issue 4. That's the one that opened me to the world
of ST. I bought the magazine because I desperately needed a blank disk
for college. After spending my lesson not doing my work, but reading
the magazine (especially the section about the new STe) I knew I had
to get one.

## 301. [PUB$ New Belgian-ftp server

Newsgroup: comp.sys.atari.st
Date: 2007-02-13 18:41:58 UTC
From: Martin Byttebier <donotusethisaddress@pandora.be.invalid>
Message-ID: <pan.2007.02.13.18.42.02.25853@pandora.be.invalid>
Source record: 6215

As many of you already know, a stubborn sysadmin of the Belgian ftp-server ftp://chapelie.rma.ac.be closed down the server. Saka tried to convince the new sysadmin to restart the server but alas he refused to do so. This means the chapelie is a dead end.

But now there is a new Belgian ftp-server. Saka has set up his own server and has kindly given me the permission to use his server to maintain an Atari dedicated ftp-server. As the sysadmin of the Chapelie refused to give Saka a back-up of the former ftp-server I had to rebuild things from scratch. As it is, at this moment the new server doesn't have all the archives that were on the Chap yet, but I'm working on it.

You can find the new server at this address:
ftp://kurobox.serveftp.net:3021

Be aware though, due restrictions of the ISP which hosts the server one must use port 3021. By default a ftp-client such as gftp (Linux), aftp (Atari) or wsftp (Windows) uses port 21 but this can easily be changed.

If one use a browser just use the address as mentioned above.

Anonymous users can only upload things in the incoming dir. Please place a short description in plain ascii of every new upload you do. This way it's for me much easier to find out where the archives must be placed.

For complaints and remarks about software send a mail to:
nightowl /AT/ scarlet /DOT/ be

For problems and remarks about the server send a mail to:
saka /AT/ village /DOT/ uunet /DOT/ be

TTFN,
Martin

## 311. Sudoku solver sor ST

Newsgroup: comp.sys.atari.st
Date: 2007-02-14 18:25:28 UTC
From: Guillaume Tello <houten.van@wanadoo.fr>
Message-ID: <45d35418$0$5092$ba4acef3@news.orange.fr>
Source record: 6225

Hello,

I wrote a Sudoku solver. You can find it at

http://perso.orange.fr/gtello/sudoku.zip

it comes with ST and TT versions. The interface is as ugly as possible but the solver seems to be efficient. I tested it with very hard puzzles and the solution comes really quickly (0,01 second on my TT and 0,06 seconde on my Mega STE).

Interface in french but a SUDOKU.TXT includes a short english explanation.

Have fun!

Guillaume.

No, but there is known trouble with DD-Floppies and Windows XP. There
are some patches around, but they did not work. Who cares...

DOS (MS-DOS) and my trusty 'TEAC' 3.5"HD IBM-PC Floppy made always good
efforts to me. ST Disks, AMIGA Disks, Synthesizer
(Sampler) DD Disks etc.

Best Regards,

Daniel Mandic

Hi Chuck B!

I think you can also copy your needed files to a DD or HD (when your ST is outfitted with a HD-Drive) Floppy and copy them afterwards to your ST Harddisk, or start them directly from the MS-DOS5 formatted Disk.

Some Games come with other format and a plain 720K Disk would be too small to carry all data. So STDisk, or similar.
Normally a PC Floppy can write up to 1MB or 2MB, for HD variants. 4MB with ED, etc. Unformatted...

924KB ATARI diskettes for example... STDisk..PC (with real DOS) No problem!

Best Regards,

Daniel Mandic

## 317. Re: Video playback on Atari ST(e)

Hey Guillaume,

MPLAYER supports VideoMaster FLM videos with sound.
But the last version I tried there was a bug on the sound.

There were 2 VideoMaster Carts, One just for the Falcon and one for
the ST/STE/Falcon.

Not sure if this bug was fixed but here is some info that may help.

For VideoMaster Falcon videos with sound. The sample Rate is Fixed at
12.292kHz 16Bit Stereo. According to the VMF Manual.

The Earlier VideoMaser cartridge for the ST/STE/Falcon didn't have a
fixed
frequency! It started out at 1KHZ and went up to 16KHZ in steps of 1
KHZ.
I can't find anything in the manual about the samples being mono or
Stereo.
Or 16Bit or 8Bit.
I think they are 8Bit Stereo, but do not know for sure as I have no docs
on this.

Anyone know for sure?

Reason I mention this is that I remember getting static when playing a
Video and
Sound FLM file recorded from the VideoMaster Falcon Cart IIRC.

Maybe you can do a update to Mplayer to play all the VideoMaster Sound
files
correctly if you haven't done so already.

Agreed! Oh what I would give, if they could have lasted just that little
bit longer and gotten the next Falcon model out the door. The one with an
'040 processor, internal slots, CDROM etc,...

Imagine what the ever innovative Atari community could have done with that!

:)

FamilyNet International Newsgate

Atariscne is still out there? Nice!

Well there are two other chats. One happens on Sunday at 10 am CST (Euro Chat), and another on Tuesday at 8 pm CST at telnet://www.atarinews.net

When logging in, follow these steps... bbs, bbs (enter name & password), enter, t for talk, c for chat, enter a name, and then you're in!

The other chat is another Atari chat also going on 24/7. The way I know to get there is a telnet interface, since I get there with the Atari 800 I have. telnet://irc.atarichat.net

On this, type "atari" at the login, don't worry about a password, enter a name, and you are takien directly to the IRC chat. They meet specifically at 8 pm on Thursday (CST) but you can go there about any time and find someone.

It is truly a good tie to be an Atari user. ;)

It's funny afterwards reading those lines: they gave us the CD drive
when the world simply wouldn't want it... and more. And when we wanted
it, they were too late getting it out time and time again. I said it
before and I say it again: Atari died because of their own stoopid
logistics.

Louis

Hi!

Just out of curiosity: How do you implement the solver? I know that one
can map the problem to an ILP problem. Do you do this or do you just
perform all the things that a human does by hand iteratively?

I don't know what ILP problem is, sorry, I'm not english... and never
made comiter studies.

The solver has two levels:
- the first one is close to the human behaviour: eliminating wrong cases
by row, column or bloc, and finding pairs to reduce the possible cases.
- if this fails, the solver makes a "guess" on one unsolved position and
tries to solve this new puzzle: if the puzzle appears to be impossible, then
the guess was wrong and this eliminates a possibility.

This is done recursively and works very well. I solved a puzzle named
"the hardest sudoku in the world"... Don't know if one should believe it,
but it's true that my solver had to make several levels of guesses before
solving it.

Guillaume.

You can just simulate the mouse through the joystick port if you don't need the keyboard simulation. Otherwise, for the keyboard simulation on the Atari ST, it connects to the 8-pin connector where the keyboard goes on the 1040ST. Joystick port is the DB9 connector. There are no drivers required so the joystick/mouse simulation works with all applications.

See http://www.krishnasoft.com/sps.htm for more information. Thanks for your question.

## 333. CTPCI and ATI Radeon

Newsgroup: comp.sys.atari.st
Date: 2007-02-15 22:56:44 UTC
From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <45d4e52c.0@entanet>
Source record: 6245

Seeing that Didier is working on an ATI Radeon driver for the CT-PCI project
I went and bought one to try it in the Milan.

http://perso.orange.fr/didierm/ct60/ctpci-e.htm

Sadly it doesn't boot. Presumably the code that bootstraps the card doesn't
work. The Milan seems to boot, based on the disc activity that I can see.

Is it the bootblock code that starts the gfx card ?

Peter

Can't confirm! Fiffi v1.30 hasn't any problems with and FF 2.0.0.1
also not...

Writing a solver apparently is much more fun than do the solving.
:-)

I remember Rubiks cube.
I only bought one when I discovered that they could easily
be taken apart and reassembled.

I never got the patience to actually solve one.

Yes. The bootblock has to bring up the card at least in textmode and switch
to VGA mono before starting TOS. There is a (limited) X86 emulator that can
emulate the card BIOS, but that may need fixing for newer BIOSses.

Hi again!

The sudoku you solved has 23 numbers in it, but I think the hardest
one's only have 17. Here is one with 20 numbers only:
http://de.wikipedia.org/wiki/Bild:Sudoku_9-9-20.gif
Maybe you want to try this.
Anyway, nice to read that you did it in Assembler :-) Cool!

Matthias

It seems that the number of numbers is not directly tied to the level of difficulty. Because, solving your puzzle with 20 numbers was made without any guess: only elimitations with rows, columns, blocs and pairs.
The one I tried before requiered 6 levels of guesses before bieng solved!

Yes in assembler it was the best I think because I use a lot of binary operations to make the eliminations and my puzzle only needs 324 bytes of memory with bit fields. So the cache of 256 bytes gives a real power.

Guillaume.

I did test the site with lots of ftp-clients, wsftpPRO (Windows), gftp
(Linux), Kasablanca (Linux), ncftp (windows and Linux), blazftp (Windows)
and rbrowserlite (Mac OS X). All works fine.
I did tried out CuteFTP today and yes initialy I had the same prob as you
have. However this is just a setup problem. I enabled pasv. mode and
firewall access and now CuteFTP does list the directories.

I know nothing about the Milan, but the TOS404 works on the M5484LITE
Coldfire board so nothing is impossible, if the flash size is 512 KB I
can create a 3rd target.
The TOS boot for example in 1280 x 1024 x 16M (boot and desktop) on a
CompactFlash card. A 2nd life for the Milan, just an idea... Peter you
have a 060 on your Milan ?
The PCI bridge isn't a problem the PLX 9054 is compatible with the PLX
9080, but I need some sources for insert some patchs like serial port,
keyboard and mouse, disks, there are an IKBD on the Milan ? Else it's
impossible without lost time, without hardware to create another target.
Maybe another problem the PCI drivers and TOS patches are GPL.

Regards,

Didier.

The Milan has 512KB Flash - part of that is used by bootblock and modular
drivers (eg. for PCI SCSI cards), but since the TOS is compressed, there is
plenty of space left.

>The PCI bridge isn't a problem the PLX 9054 is compatible with the PLX
>9080, but I need some sources for insert some patchs like serial port,
>keyboard and mouse, disks, there are an IKBD on the Milan ? Else it's

>Maybe another problem the PCI drivers and TOS patches are GPL.

GPL would definitely be a problem - I doubt that you can legally incorporate
GPL code into TOS on any machine, because TOS is not GPL and not
GPL-compatible. Distributing patches only moves that problem to the user.

However, even without the licensing issues, it would not be that easy: the
Milan uses a heavily modified TOS which integrates code for the Milan
hardware, PCI BIOS, hardware emulation etc. - I doubt any patches against a
binary TOS 4.04 would apply easily.

However, i do not see why TOS patches should be needed at all: the graphics
driver can be loaded from the auto folder (or as a pre-auto flash resident
module on the Milan). That only requires basic standard VGA init code in the
bootblock - does ATI provide documentation on that part that is usually
handled by the X86 BIOS ROM?

Chuck B wrote:

> What I am tryng to do is this. The files are in .st format. I need
> them to not be so I can read them on a pc or st.
>

You can insert (open file, of course) them in 'Steem' Emulator and read
and write.

If you have problems making Disks with your PC-Floppy, greater than
720K:
Sending the .st file with a Nullmodem Cable (PC-Atari) and writing then
with the ATARI to a Disk is also a solution.
But parting the .st file onto 2 or even 1 720K disk, with an archiver
program for example, STZIP. So you don't need a serial cable connection
and you can transfer over 720K formatted special ATARI Disks. Although,
I don't know how much compressable the .st files are, in the worst case
you have to use 2 disks to archive a greater than 720K Game/Disk.
Zip can make verbose files, with 720k each or 1440K... Option -v720 or
-v1440 for HighDensity or even -v500 should work and would make an
archive,
parted into 500K files.

I say this, because I have heard about troubles with PC and making
ATARI disks. In this case the ATARI itself is your help. Getting the
.st file there, is hopefully well explained by me now :-)
MS-DOS formatted disks 720K should work well on ST!

In 'Steem 3.2' root directory is also some text to read.... DiskIMG
program, how to use... etc etc...
I think .st files can be read by any Computer. Atari or PC... Amiga,
Apple OS, Linux and so on. Making floppies out of it, is best managed
by a ST, of course, and recommendable to do so (to prevent I/O errors,
due to floppy-drive differencies, also PC's have known problems between
two different PC Floppy drives, other Brand etc.)!!!.

Best Regards,

Daniel Mandic

I order CT63 in november 2006. and pay it 300euro. Now I waiting for
rolophe to finish this, as he said, last batch of CT6x cards!
But I think there is a chance to get one CT63 card if somebody gave up
from his CT63 that he order at the end of 2006.

I send you Rodolph email on your email adress ;)

I use also an LZ77 compression for the PCI part (above 0xEA0000), I
think also use space between 0xFC0000 and 0xFF0000 for get free space
for USB drivers.

> >The PCI bridge isn't a problem the PLX 9054 is compatible with the PLX

With sources of specific hardware, it's easy, else without sources and
hardware for test it, it's just impossible. I have worked on M5484LITE
board patches, on month before get the card, and 2 months for get a TOS
working with the Radeon.

> However, i do not see why TOS patches should be needed at all: the graphics

> bootblock - does ATI provide documentation on that part that is usually
> handled by the X86 BIOS ROM?

I don't know, actually the X86EMU used works fine for start the VGA BIOS
(91KB), but I have tried INT 10 without success (black screen), it's not
important for me because the init of the card is finished and the radeon

driver works fine (256 / 65K / 16M), the driver start before the Setscreen 1st call. The VDI rebuild in assembly language in ROM is also faster than fVDI because direct calls are used for replace generic fVDI calls, something than 10 times faster on blitting and text functions. And the BIOS part is not inside the FVDI.SYS drivers, so it's impossible to use new Setscreen modes, and other functions added like VIDIX (actually fulscreen with the scaler for Aniplayer with a YUV or RVB source), or TV port on the Radeon AIW (this lastest part isn't finished). Sure it's always possible to work on a TSR program started before fVDI.

Regards,

Didier.

I can, being around at the time. I bought an STE because I wanted to write MIDI programs. At the time I bought it it cost around the same price as a PC midi card. £200 or say $/?400 It was an affordable computerer. And on adding a second floppy I could write decent programs using the free Sozobon compiler which worked well. Later when I could afford it I added a 40 megabyte hard drive. I then used this to program. I wrote and adpated games for my kids. I wrote a program to get the Sysex data from my Yamaha organ, edit iot and write it back. All in All a very nice affordable machine but already starting to look dated next to PCs.

On the other hand I think perhaps the STE was the machine that finished Atari off. It could still only do a 64 color display. It had no expansion

capabilites. SCSI adaptors still cost a small fortune. No where to go up at a reasonable price.

Then look at the Falcon, which should have been the next step up. From looking through old adds I can see the cost was £1,300 / $ 2,600. At the time this was prohibitvely expensive for any one other than the proffessional musician. Yes it could do Hard Disk recording but only a small fraction of the public wanted that. And at the lower end STs were starting to look very sad against PCs with VGA displays....

Nope not suprised it was their swan song.

>
> Tim

Dave.

P.S. and then there was my favourite gripe. The Atari Developer Program. It cost more to join that than the cost of the Atari. Talk about cash cow...

## 356. Objc_edit and mint/MyAES

Hello,

I'm working on my SUDOKU solver and I'm using a custom "form_do" to use a
dialog box into a window.
With normal TOS, it works perfectly.

Under freemint+Myaes I just can't fill any FTEXT. Cursor goes from one field
to another (TAB or arrows) but I can't write any digit into the boxes.

Guillaume.

Wow! What model was that? I bought the first one I could find available in
my area, for $799 base model. Added a small internal HD and RAM, had a
total of around $1000 in it...

Thanks.

You can make usage of freeMiNT+XaAES from which latest snapshot is there

<http://storage.atari-source.com/atari/mirrors/cvs_builds/>

find help either on this unofficial forum

<http://www.atariforums.com/list.php?26>

or on the freeMiNT/XaAES official mailing list

<http://sparemint.atariforge.net/mailinglist/>

If you use ARAnyM, freeMiNT+XaAES is already installed in

<http://eureka.atari.org/xa-my-aes.zip>

Mind that MyAES can't be distributed with ARAnyM according to its
explicit license <http://myaes.lutece.net/LICENCE>

I hope it helps,

Regards,

Hi,

Sure, I will send you a .FLM Video with Sound that I captured
awhile back.

I have it Zipped and ready to go on my VAIO Laptop, but
my Son is using it at the moment.
Will get it to you ASAP.

BTW, unzipped its around 9 Megs.

If you need it to be smaller then let me know.

Thanks,
Barry

I am looking into getting an Atari ST. I grew up and was in high school/college during those years and have a desire for a lot of the older computers. I'm actually getting a Apple II currently and am looking at a Amiga 500. With Atari being so big back then I want an Atari as well. Should I look at the 520 or the 1040 or is there another model? Since I only used Commodore back then I know little about Atari.
As well, my main concern is the monitor. What type of monitor does the ST use? I have all LCD vga/dvi monitors now. I prefer to be able to share monitors so would it output to these?
What are the best sources for ST software/games?

hello guillame,well whats new?
i too have been fooling around with this type of thing , but under
normol tos.i dont use the Xaes of sparemint ,sorry.....
my only suggestion is make sure that the length of your default string
"ptext"is specified in the "ted info" and that the template
"ptemplt"and valid "pvalid" strings are the same length too..as your
text string.

second thought is maybe drawn to wrong vdi handle?

i really don't know for certain but hope this helps.

what i been doing is similating a backspacepress before cursor is
drawn so field is cleared and ready for input once drawn..this keeps
the cursor to the leftmost of the area instead of right .
so are you able to move your cursor to the left and the right of your
field
instead of up and down?

also when your object gets drawn include a larger number for the
"levels to be presented"

ok
charles

Go for the Mega 4STE.
The video output on the Atari's was non standard.
As for printers...start with one of the Epson dot matrix printers. You will not need any drivers.

I would say the best st to get is a regural 1040 st. This is the most compatable of them all. I have 1 1040, 2 520's, and 1040STes, and thanks to a ebay jerk a free Mega STE. The mega has some compatablity problems with some games, but not much.

Ronald,

I only found sterling prices. I guess we had the old thing where US prices were cheaper. The price was for a 14meg model with HDD included. But how much was the base ST(e) in the US at that time $250 dollars? Three times the price for the Falcon! I cannot deny its three times the machine, but considering the original STs targeted young folks for games play it was out of their budget....

Dave

Let me see if I understand all this...

Didier, your Radeon code is in a modified TOS ?
The Milan uses a bootblock routine to get into VGA mode and then starts
the ATIDRV.PRG from the AUTO folder to provide the full driver.

The current Milan bootblock doesn't start the Radeon in VGA mode.
What documentation is there about booting the Radeon ? Is it very
different to booting the Rage ?

Other thoughts

Future version of FreeMint may not rely on TOS to boot.
Could EmuTOS be patched to work on the Milan to avoid licensing issues ?

Anyone wamt to borrow a Radeon card ?

Regards,

Peter

Get Any STFM/STe. Try to get a 1mb machine.

If you get the Amiga 500, and if you get it with a 1083/1084 monitor,
you can get another cable and share it with the ST.

That not what I read. Maybe the French and English texts read
differently, but the English part says that you CAN distribute it with
ARAnyM, just not COMMERCIAL emulators like MagiCMac. From the LICENCE
text:

CONDITION OF USE OF MYAES

MyAeS is free for personnal use, You can install it on your computer
freely, MyAeS can be distribute only if product is totaly non
commercial(for example AFROS disk for Aranym at Aranym web site) .
In all other cases (magazines, commercial emulator like MagicMac
etc..), can't be distribute without agree from the authors.

Yes but it's possible tu use the VDI part (radeon.sys) with fvdi.

> The Milan uses a bootblock routine to get into VGA mode and then starts
> the ATIDRV.PRG from the AUTO folder to provide the full driver.

Actually with X86EMU I run the VGABIOS of the Radeon. I have tried
without succes to set a monochrome screen with INT 10, but it's not
important on the CT60 because the radeon driver works before the boot
screen, the XBIOS Setscreen has new modes until 1600 x 1200 x 16M (with
virtual screen or not).

> The current Milan bootblock doesn't start the Radeon in VGA mode.
> What documentation is there about booting the Radeon ? Is it very

You need to run the VGA bios with a good X86 emulator. Latest VGA BIOS
has 80386 code.

> Other thoughts
>
> Future version of FreeMint may not rely on TOS to boot.
> Could EmuTOS be patched to work on the Milan to avoid licensing issues ?

Humm, not by me... For you I have just my solution (a 3rd target), but I
need sources for specific Milan hardware.
Emutos is a sort of alpha TOS, on the Coldfire board I use his BDOS part
and for exmple it's impossible to rename a folder. For me Emutos is too
light for run Falcon and Milan machines, it's just a tool for Aranym.

> text:
> ...

Well. You have no clue why MyAES is not included, either on

<http://ebmodel3.atari.org/Pack_3D/> or in
<http://eureka.atari.org/MacAranym.zip> or in
<http://eureka.atari.org/xa-my-aes.zip>

that are 3 well known ARAnyM configurations where it is not included.

Except if you admit that MyAES can't be distributed with ARAnyM.
That's the entire responsibility of the author, that prevents its
distribution in combination with ARAnyM. That's what is also written
in the license. The author can choose whether it is diffused or not.
He always refused it for ARAnyM. I'm sorry, it is just a statement.

I can't help it. But the author of MyAES used to accept it, until
he decided to promote the ColdFire machine. I was at this period
involved in MyAES developments and its debugging. The author denied
me the benefice from my work, and rejected me.

The configurations that I'm speaking about are not commercial.
It should be allowed. But the author have a precise idea of what
type of work he want to promote. I had to pay the price of this
peculiar way to license MyAES. One must be aware.

XaAES is free and no such tricks in the terms of the GPL license.
That's why I'm advising XaAES, and to benefit from the community
around its developments. XaAES is a great thing, indeed.

I don't want people to loose their energy pure vainly.

Regards,

The new user reg process is bad these days. It's enough trouble as it is
to get people to use BBS's at all now.

Thanks,
Mark

As far as I can remember, and someone please correct me if I'm wrong, but
I believe the base model STe at that time was $399.00 in my area.

I'd have to agree though, for non-dedicated Atari fans, it was probably a
bit on the steep side... :(

Well, at DarkForce, we've been averaging over 100 calls a month, (sysop
calls are excluded in that count, although my regular user account isn't)
but then, I'm giving away prizes as incentive for callers to visit us. :)

If you're in Europe, the output couldn't be more standard. 15.75Khz is what the RGB SCART/EUROCONNECTOR on the back of televisions uses. 31.5Khz is basic VGA.

Things are brilliant are the moment with the new LCD televisions coming out, since they accept both SCART and VGA inputs. It's as if they're made for the ST.

Unfortunately there is no SCART standard in the USA.

## 383. Re: Video playback on Atari ST(e)

Newsgroup: comp.sys.atari.st
Date: 2007-02-19 14:57:40 UTC
From: pkpera@sezampro.yu
Message-ID: <1171897060.888562.87670@k78g2000cwa.googlegroups.com>
Source record: 6197

I made first tests with playback from DVD/CD. With IDE interface - it
has good transfer speed, may be up to 1400KB/sec
Works fine, no any stop, slowdown - tested with NEC 2510 and Pioneer
116 DVD players, and RW DVD & CDRW..

But not with standard drivers, because of required byte swapping.
More on site: http://www.ppest.org/atari/movpst.php

Compression: I don't see a way to achieve some useful compression with
clips like those on site. Any better compression would need too much
CPU time dor decompress. Gain could be only 10-20%.
For simpler matherial, with less complex scenes RLL may be choice. Or
some kind of delta frames - for case where there is little change
between scenes. But concept gives not much space - because of used
double framebuffer displaying we need to take changes not between
present and previous frame, but 2 frames back, what spoiles possible
gain...

## 384. Mega STe Case

Hey guys,

Looking for a Mega STe case, or perhaps a TT case if it can be modified to accomodate a Mega STe. I didn't look into that.

Obviously not looking to pay very much, but let me know what you want and we'll talk.

The case doesn't have to be very clean at all, just looking to get rid of my 100 pound tower that currently houses my mega ste and replace it with something compact and plastic.

Thanks,
Mark

## 387. addon ideas

Newsgroup: comp.sys.atari.st
Date: 2007-02-20 11:56:55 UTC
From: Jammer <meva90@yahoo.co.uk>
Message-ID: <45dc31d5$1@news.greennet.net>
Source record: 6101

This message is for all you techy types out there wondering about what to design next for the Atari.

Hereï¿½s my ideas on what mods/addons could be built for the ST/STE and Falcon. First off, I think they need to be something that makes the computers more usable for the majority of people.

ST/STE - an adapter that will enable you to get low/med/high resoloutions on a PC flat screen (not an LCD tele, theyï¿½re too expensive) and a compact flash card (or SD etc) adapter that plugs into the hard disk port. Imagine your ST hooked up to a flat screen and with a 1Gb CF card drive, fantastic !

Falcon ï¿½ a simple adapter that would plug into the LAN port and allow you to network to a PC setup (I have heard that an Ethermac adapter may do this ???)

There are probably plenty more addons that have been talked about, but I think these would be must haves for anyone with an Atari, and would encourage people to use their real Ataris more often, which is what its all about.

Cheers
Jammer

Great ideas!
I have a compact flash adapter for my Apple IIe and TI 99 4a. For sure
that I'm really using them since I got those add-ons.

The adapter for video on ST(E) could come with a PS/2 keyboard and mouse
adapter, all in one.

Guillaume.

SD card that plugs into the HD port ACSI - Satandisk?

http://joo.kie.sk/satandisk/
http://ihrisko.org/~mikro/sd_preorder/

LAN 'card' for Falcon and ST - NETUS-bee?

http://hardware.atari.org/netusbee/netus.htm

couldn't find anyone doing the connection to a PC flat screen, would
need some sort of frequency doubler for the low (15khz i think)
frequency the machines produce for low/meduim res. High res is fine
just needs a suitable cable.

A 17" LCD TV costs about ï¿½50 more than a similar LCD monitor. I doubt that
it's possible to sell a scan-doubler cheaper than this.

Just an update.. the registrar I use for my domains is having some
serious issues. Check out this post on Slashdot..

http://slashdot.org/articles/07/02/20/0024233.shtml

This includes my Atari domains:
atari-users.net
atariforums.com
atariforge.org
atariforge.net
sparemint.org

also
gemcandy.org and ataricq.org

So, if one of these goes offline.. you know why. I am looking at
registering similar domain URL's ( different extension) on a new
registrar. When I have a backup URL's I'll post here.

Rob

I'm working on it as we speak.

The idea is that you have a printer that's supported by your existing parallel port printer drivers (like NVDI) but you print to a file. Then, you drag this file and drop it on the printer icon on your desktop. The installed printer driver will pick it up, and pipe it to the USB printer. For this to work you will need drivers that support a protocol that is close to the USB printer that you have, like ESCP for an Epson, HPPCL for HP, for example. I only have Epson photo printers, but I'm sure that as soon as I get a working program out, and the bug reports come flying in, more printers will get supported.

I know it's not the most elegant solution, but it's probably the most efficient way to implement a USB printer that will work on all configurations.

Hi,

here is the SUDOKU solver with its GEM interface. It should run on any machine, any resolution and TOS or Multitos systems.

http://perso.orange.fr/gtello/ in the 'download section, in the English column.

There's still a problem with the cursor under Aranym/Xaes. It's not displayed in the current edited box. Hard to find where we are...

Some options: LOAD/SAVE puzzles, TEST (just says Ok or Error without displaying the solution, SOLVE (to get the solution).

Well, that's all... A CREATE option will be available (I hope..)

Guillaume.

Sounds like a compatible solution.
In addition, perhaps printer drivers that print directly to the USB
printer could be implemented later on (or rather, "dummy" printer
drivers that would do the task of draggin/dropping the saved file to
the desktop printer icon).

Where will the USB interface connect to? Will it be an internal
solution, or connect via ACSI/SCSI or the cartridge port?

Looking forward to hearing more about it.

Hallvard

Hallvard, You have been around the atari scene a long time. I'm
surprised that you haven't heard. So for the benefit of the first time
hearers, here are 2 options that exist so far:

For CT60/3 owners the EtherNat provides Networking and USB. For
everyone else with a cartridge port, Lyndon's NetUSBee (http://
hardware.atari.org/news.htm) provides EtherNEC compatible networking
and EtherNAT compatible USB. On Lyndon's website you can see a video
of one of the NetUSBee prototypes running an early alpha of the mouse
driver I have developed.

Been away for a while and haven't had the opportunity to catch up to
see what's actually available and what's "hopefully available
soon" ;-)

Yes, just saw the video today actually.
With my long daisy-chain of cartridge devices (4 so far) I'm a little
hesitant to add any more to it if possible.
And I haven't been able to find out exactly what the USB interfaces
are capable of. For me I really only care about printing as getting a
Centronics interfaced printer is hard these days, and as most Atari
users nowadays also have a PC or a Mac it would be nice to share one
printer between the two computers.

By the way, does the USB interface use a lot of processing power from
the computer? I heard somewhere that the computer's processor itself
does all the brainwork of USB. While this probably is no biggie for a
modern computer with endless memory the situation for the ST is a
little different.

I haven't had a printer for years, but when I did have one I used a
buffered /dev/lp device driver and let NVDI print to u:\dev\lp. You could
do something like this, then it would be completely transparent to the
user. It would only work for MiNT and MagiC though.

USB controllers vary in how much processing they require the host to
do. There are OHCI, UHCI, EHCI and then there are chips that the one
thats used in the EtherNat and NetUSBee (Philips ISP1160), which is a
sort of semi OHCI compatible at register level with some other
requirements. Yes, the host chip does need a lot of work if you
consider a complete fully featured USB stack. I don't know yet if this
will be possible even on a standard unaccelerated Falcon 030, but in
the meantime I am writing several monolithic (stand alone) drivers
which have small parts of the three required layers in each one (HW
driver, USB stack, and Class (device) drivers). The mouse driver has
already been tested on an 8mhz 1040STFM and its silky smooth, with no
noticeable performance hit (although this is hardly a scientific
measurement ;-)).

I have some ideas how to realize such adapter (already have internal
IDE interface which works with CF cards too).
People wants of course external solution, without soldering in
machine. (Flat screen is attached too, btw. :-) )

Now, question is how big is interest for such interface. In any case,
it will be much faster than Satandisk, which is too slow for any
serious usage.Compact Flash is best for ACSI ports from some reasons,
and costs just little more than SD cards.
Let interested people post here. Price should be under 40 Euros in
any case.

PP

I'd be interested in such a solution.

Source record: 6126

I just updated old WEB page with project IDE interface for Atari ST machines.
There is now some new software for testing speed and access time of drives.

http://www.ppest.org/atari/astide.php

That's impressive and very useful for many of us.
But would you mind uploading the actual files which you have for designing the schematic? Perhaps you also have a PCB layout file as well. I personally use Eagle, but if you use a non-common format, perhaps you could export some sort of generic format which can be imported into most CAD software?

Hallvard

## 415. HD Partitions

Newsgroup: comp.sys.atari.st
Date: 2007-02-24 16:50:24 UTC
From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <45e06cd0.0@entanet>
Source record: 6129

Hi all,

My 2Gb disc is getting quite full. I also have a 20Gb disc in the Milan all ready partitioned. A few years ago I copied the 2Gb discs partitions onto the 20Gb disc. I also have some big files on the bigger HDs partitions.

I now want to copy my main partitions onto the bigger drive. Is there am easy way of doing this ?

I was thinking of doing a cp -prvu from bash but there may be a better way.

But before I do, there is currently a problem with the first partition on the 20Gb drive.

When I boot the Milan it often reports a problem. I use 1-15-12 so it doesn't give much detail. With 1-16 it says:

FATFS[N] vital data illegal
(recsize=0, numcl=-4177919)

I have tried to fix it with a few disc apps but nothing will touch it.

Does anyone know how to fix this or should I just wipe the partition and try again ?

Peter

Would the X86emu code be of any use to the Milan TOS ? If it has better
80386 emulation then it might start the Radeon.

I am not familiar with X86emu but I see that others are using it to
start Radeon cards:

Yes but maybe his code size is too big for the bootblock.

I remember to fix problems with big endian. The VGA BIOS works until the
end (no crashes, the end is a halt code because the caller is 68K).

Regards,

Didier.

That might be used - If I google'd right, x86emu has a BSD-style license.

That leaves only the matter of space[1]: the current X86 emulator in the
Milan bootblock is below 32k of 68k assembler, and there is not much space
left.

cu

Best if you save all relevant files to another disk. It looks that
your 20GB disk becames damaged, unreliable.
After saving all datas you may try to format it again, but if you get
some bad sector reports better forget that drive.
If no other disk, copy files to some other partition on same disk and
try with format.
Again, if bad sectors beeing reported better get another drive. As
temporary solution may be to use that drive without first partition...

Source record: 6136

Hello Atarists!

ST Magazine issue 139/140 is available. This issue is very late and we are sorry for this. Due to the big delay, we decided to make a 48-page issue (instead of 36).

By the way, issue 141 will be ready very soon (end of February).

All ST Magazine issues (except 132) are available at 16/32 Systems. Don't miss the special issue about the 20th anniversary of the Atari ST.

And for console lovers, ReVival will be available soon at 16/32 Systems because the latest issues are now translated into English (issues 29 to 32). Of course, ReVival also speak about Atari consoles!

Link to 16/32 Systems:
http://www.1632-sales.zenwebhosting.com/acatalog/ST_Magazine.html

Link to ST Magazine web site:
http://stmagazine.org/
- Note our web site includes fresh news about Atari computers -

Thanks for reading :)

Since it is not the hard disk driver that reports an error but the
operating system this looks very much like a logical error in the FAT.
It does not seem to be a physically damaged hard disk driver, otherwise
the error message should be different, e.g. an alert box displayed by
the hard disk driver.
In case of an error in the FAT most hard disk tools should be able to
find it and maybe also to repair it. DISKUS has special functions for
checking and reparing FAT (FAT16, not FAT32) file systems, but it is
German only. If you know a bit German you can give the demo version a
try: http://www.seimet.de/diskus_english.html. But please note that the
demo can only check file systems, not repair them.

Actually, I don't use software for design. I do it on paper mostly -
it is creative process, where computer can't help much.
In any case, I will post schematic for simpler version of interface.
I can draw it with free Express SCH . Then Express PCB can import
schematic and may design PCB. (Link is on page)

Or you know some other, better freeware - which has format more
usable in other programs?

Macromedia ?! Not very useful on the atari.

With all this USB work in the pipeline for ST, Falcon and even the 8-bitters (I believe). I feel that us clone users might be left behind. Hardware-wise these are the easiest machines to USB enable, I could just stick a pci card in. Have ny tests been done with a Milan and a pci USB card ?

I am sure it is just a logical disc error.

I have the Diskus demo but I don't speak enough German to risk using it.
When I try Diamond Edge it won't switch to that disc because it doesn't
recognise the boot sector.

Is there anything I can do with HDdrutil ?

> Is there anything I can do with HDdrutil ?

No, HDDRUTIL won't help you here. In general, if a boot sector is not
recognized you should read the physical hard disk sector the boot sector
resides on in order to check and/or repair the contents. With Diamond
Edge you can surely do that.
I wonder, though, why MiNT seems to report something on a FAT sector.
Looks as if MiNT can access the boot sector but Diamond Edge cannot?

As far as DISKUS is concerned, since the demo version cannot write data
to the drive you cannot damage anything with it.

It's not that simple - by 'tests' you mean 'development', and by 'easiest' you mean that you can feel free to pop down to PC world and buy a cheapo USB card? Do you recall if this PC hardware hand-me-down strategy worked for Network Cards? Do you know how many USB controller chips there are on the market? And of these, how many standards do they follow? Why do you think that windows has tons of drivers just for USB host chipsets? We cannot rely on everybody to buy the same USB card (which won't exist on the market maybe 6 months later), and have it work with only one driver. It's impossible.

Oh, and what's a Milan?

I disagree :-)
After I started to learn Eagle I've found that it's extremely useful.
Not only can you edit your schematic at any time without having to use
your eraser or worse yet start drawing your schematic from scratch
again on the paper, but you can also create a PCB from the schematic
very easily.

Actually, once you're finished designing the schematic in Eagle you
can just press the "board" button which presents you with a PCB where
you place your components (already connected together thanks to the
schematic design section), and when you're happy with it you can have
Eagle automatically route the PCB traces where it finds the distance
shortest etc. Very impressive! Naturally you can do this manually or
combine the autorouting function with manual routing.

And of course you can share those files with anyone else so they don't
have to start the whole project from scratch again.

> In any case, I will post schematic for simpler version of interface.
> I can draw it with free Express SCH . Then Express PCB can import
> schematic and may design PCB. (Link is on page)

You mean this one? : http://www.expresspcb.com/ExpressPCBHtm/Free_schematic_software.htm

I had a look at that page a while back, but since I'm on a Mac I can't
use it. Besides, doesn't that program use a special format which is
meant for people to order the PCBs from that same company so you can't
save it as a format which others can use to make their own PCBs at
home or order from wherever they like?

> Or you know some other, better freeware - which has format more
> usable in other programs?

I've tried a bunch, but as I've never had any experience with PCB
design software in the past I found it very frustrating to figure out
these complicated programs.
Besides I learnt that many relatively unknown programs with few users
also meant fewer parts for the schematics and PCB design (it takes a
while to design your own parts!).

So learning about Eagle, hearing that it's very popular among hobbyists and with large libraries I found the choice easy and decided to invest time in learning it. I'm still a beginner, but at least I understand the basics.

And because of it having so many users it already has huge libraries of parts available and even a couple of newsgroups for support directly from Cadsoft (the company behind it) and is available for Windows, Mac and Linux platforms. The free version allows you to create PCBs up to 100 x 80 mm, which is one of the reasons it's so popular with hobbyists (if you need to make bigger PCBs or have more than 2 layers you need to buy the professional version which is expensive).

You can download the free version from: http://www.cadsoft.de/freeware.htm

I'm curious, what sort of differences are there in the RGB signals
that component video sends out from, say, a DVD player, versus what
comes out of an ST? I'm not talking about composite or S-Video, I'm
talking about the red/green/blue RCA jacks on things like DVD players
and such. I'd like to get a crisp picture from the ST over these
lines if possible.

Anyone got any ideas?

They are completely different. The 'Component' you are talking about
is not RGB, but Y'PbPr. The output from the ST is RGB and SYNC. Have
you got another connector on your TV that offers RGB input (like SCART
does - but it doesn't exist in the U.S) or composite?

ST has RGB as it is usual by computers. But I saw some DVD players
which have RGB outputs too - probably not case in US.
You may buy some RGB monitor - not VGA. Amiga, C64 monitors are
mostly good.
Other solution is S-video output - it can be made on every ST. Not so
good as RGB, but is cheap:

http://www.ppest.org/atari/stvid/stvid.php

Third solution is moving to Europe :-)

Here's something that confuses me... Most European LCD televisions with RGB
scart sockets will accept 110v-240v, and will also process NTSC signals.
And.. have a wide variation of UHF/VHF tuning capabilities.

It makes me wonder why they're not being sold in the USA. It'd be the ideal
solution.

Type "LE19R71BX" into Google. That's the one I've just bought.

I found a monitor on eBay (search computing for RGB) with ....

17" TFT Monitor with DVI + RGB Input
15-pin D-sub RGB Analog connector

Would it be possible to use this with an ST ?

Cheers

No. You are confused by the letters 'RGB'. This is a standard VGA
monitor plus a DVI connector.

I've been looking for something like this. Thanks!
But I'm a little confused about the instructions on your web-page.
So I've tried to draw the connections/modifications in the schematic,
which I've uploaded here:
http://img144.imageshack.us/img144/3893/svideo1xk7.gif

You write that all 4 pins of the Luma delay lines should be removed.
Which pins are these on the MC-1377?
Provided that I cut those 4 lines, does the rest look fine in my
drawing?

I've got a Mega STe (with a built-in modulator sending out a PAL
signal), and I would very much like to get an S-video signal, but also
composite video and RGB (via a SCART connector) in addition to hires
mono through a VGA connector.
Will your circuit *remove* composite video from the 13 pin DIN output
when S-video is added, or will it just add S-video in addition to the
above?

Finally, when you imply that RGB is better than S-video etc. are you
referring to a connection such as when a SCART connector is being
used? For example as in my video output board I'm working on:
http://img242.imageshack.us/img242/7507/vga3by5.png

I think it's still the bottom line, that the device, no matter whether
it's a monitor, LCD TV, or whatever, has to be able to sync down to 15khz
horizontal, thats the key, isn't it?

I did not cut any lead on board. Just removed soldering around pins
with vacuum pump. From above of course.
On photo it is visible which pins are desoldered. Desoldering 4 pins
of delay line is necessary because of noise.
It will not fall down has even more pins!

Yes. No composite after mod. It is price of simpleness. But you can
add some multi-line switch and switch between composite and S-video...
(just idea, but not impossible).
>

I suppose that it is for some of multysync VGA monitor. I didn't use
150 ohm resistors when connected to TV Scart-RGB. But for VGA it may
be good. Or that Scart is on some of new TFT monitors with Tuner,
video in, Scart ? I read tha some Samsung had too much saturation/
contrast without resistors.

RGB is better than S-video because no PAL encoding. Every color has
it's line. Picture is sharper because no chroma carrier (with only
4.43MHz).
S-video is better than composite because no interference between
chroma and luma. If removing chroma filter it will be much sharper.
Even align is better when no chroma filter and delay line.
Btw. I dl-ed Eagle. Will make some sch with it...

> Even align is better when no chroma filter and delay line.

What alignment?
I read on your page that you had some problems with the sync signal
because the ST's sync is apparently non-standard.
Are these problems that show up only in a connection such as yours
(capturing the ST's video output with a PC video-capture card) or also
when connecting a TV to the S-video output? By the way, those video
clips you made looked great to me. Didn't seem to be any problem as
far as I could see.

> Btw. I dl-ed Eagle. Will make some sch with it...

It's a pretty powerful program. Unfortunately it's also a little
complicated to get started if you've never used any sort of CAD
software before.
I learnt by trial and error, reading different kind of manuals I found
online and lots of patience ;-)

Align of white (luma) and colors. Disalign is caused by chroma
filter's delay - therefore we need luma delay line. But such component
are not too precise. Especially not in 20 year old machines. So if
delay in both is not same it causes something like bad convergence on
TVs. Look Nebulus composite video's counter.

> I read on your page that you had some problems with the sync signal

Problems may happen even with B/W picture (from mega ST for instance)
which has no PAL encoder.
On most of TVs you will not notice problems, but on TV cards often
people can not capture at all. On 100Hz Sony TV picture shaked all
time (with composite). Reason is non standard timing of video, and
there is no simple solution for that.
By capturing video playback from Atari ST it may happen that you will
get interlaced picture, although it plays progessive video with 25 fps
(displaying twice every frame). It is because card can not get correct
phase of video - so it may happen that on screen you see pic composed
of 2 frames, what makes interlace by movement.
Yesterday I added solution against it to playback program - it just
shifts displaying by 1/50th second later, so card will get correct
phase. All it can be done during playback (and must be so, because you
never know will it be good or not). It is too technical, but I can not
explain it simpler. On regular TV phase of video is irrelevant - there
is no such thing as composing 1 frame from 2 fields. Even TV stations
sometimes send movies with wrong phase - it will notice only people
who capturing them, not TV watchers.

> I learnt by trial and error, reading different kind of manuals I found
> online and lots of patience ;-)

What software for hard disk partitionining for Atari ST family we
have except HDDRIVER.APP ?
I don't think here on SW suplied with diverse interfaces/kits, but on
some more-less universal program?

# 447. Re: Atari ST RGB to TV RGB possible?

Newsgroup: comp.sys.atari.st
Date: 2007-02-26 18:56:50 UTC
From: SixteenThirtytwo <sixteen_thirtytwo@yahoo.com>
Message-ID: <1172516210.486963.24550@p10g2000cwp.googlegroups.com>
Source record: 6061

Trying to find a solution which will give me S-video, composite, RGB (SCART) in addition to VGA (mono mode) and of course support for all Atari monitors via a new 13 pin DIN socket I came across the following page which describes how to build a very simple S-video to composite adapter:
http://www.epanorama.net/circuits/svideo2cvideo.html

But I'm not certain what kind of quality something as simple as that can give, so further down on the same page I read about improvements to the circuit where there was mention of the AD-725 "RGB to NTSC/PAL encoder with luma trap port". The datasheet can be downloaded from here:
http://www.analog.com/en/prod/0,2877,AD725,00.html

... and includes a schematic of a VGA to composite/S-video/RGB converter. I've extracted that schematic from the datasheet and uploaded it here:
http://img479.imageshack.us/img479/3550/vgatosvideoschematicnt4.png

Obviously I have no need for the RGB output as that's already available directly from the 13 pin Atari output, or should I use this circuit instead?
Is the above circuit something that can be used with the ST?

Hallvard

Hi,

Don't know if it's the solution, but here is a more stable version of SUDOKU.

http://perso.orange.fr/gtello/sudoku.zip

- prints the puzzle (if you have a printer...)
- generates two kinds of puzzles: EASY and MEDIUM one out of two. I'd like to have your opinion: are the EASY ones really easy? Are the MEDIUM ones really MEDIUM?

It works on my TT+TOS, TT+MyAES, TT+MultiTOS, and Aranym+XaAES.

Have fun

Guillaume.

Not exactly what I meant. Surely plugging-in existing hardware and
developing software for it is easier than building hardware from
scratch and developing against that.

But if you are a hardware whizz it could be easier than buying from PCW ;-)

> Do you know how many USB controller

I get your point but what happens if Philips drop that chip from their
range, same problem. Today I went searching for some info on pci cards
that use the Philips chip but couldn't pin one down. They do make
a development kit for it though in pci and isa forms.

If there are no known pci cards using the same chipset, could one
be built ?

>Oh, and what's a Milan?

They're the people that built TOS computers after Atari ;-)

>

Original Atari software AHDI will work on small old drives.
Also CBHD works with some older drives. I think both are at:-

http://www.nic.funet.fi/pub/atari/diskutil/

However for modern 2gig or larger drives, the only software I have found
that works is HDDRIVER!.

Should work fine, both for composite and S-video outputs. If you do not need
RGB at the same time, you can leave out the AD8073 opamp buffers.

Where are you located? I have a bag of AD725AR (in SMD SO-16 housing) left,
and might give some away if shipping is not too expensive.

## 457. What's a ".SCD" file?

Newsgroup: comp.sys.atari.st
Date: 2007-02-27 09:46:25 UTC
From: SixteenThirtytwo <sixteen_thirtytwo@yahoo.com>
Message-ID: <1172569585.822635.228400@k78g2000cwa.googlegroups.com>
Source record: 6071

I downloaded the following file: http://atari4ever.free.fr/hardware/zip/rgb2comp.zip
from Vezz' Atari hardware hack site, in the "video" section (http://
atari4ever.free.fr/hardware/video.html) and after unzipping it found a
file named "CONV.SCD" which looks like it's UUencoded or something
similar, but alas UUdecoding doesn't work.

The readme file says:
---
conv.scd -- This is a monochrome degas picture scoded using Moshe
Braner's scoding program. You will need sdecode to decode it to Degas
format.
---

I have "Esscode", but apparently the above is referring to something
else as it doesn't work with this file. Any ideas?

Hallvard

This will work, although I had some oscillations with small
capacitors. Better than 470pF should be 10-100nF. Try and correct...

> But I'm not certain what kind of quality something as simple as that
> can give, so further down on the same page I read about improvements
> to the circuit where there was mention of the AD-725 "RGB to NTSC/PAL
> encoder with luma trap port". The datasheet can be downloaded from
> here:
> http://www.analog.com/en/prod/0,2877,AD725,00.html

That circuit is much newer than MC1377. So, it should be better. And
it can give S-video and composite at same time.
>
> ... and includes a schematic of a VGA to composite/S-video/RGB
> converter. I've extracted that schematic from the datasheet and

> Is the above circuit something that can be used with the ST?
>
Yes.
For PCs it is obsolete now - every newer GF card has PAL out.
There is also MC13077 chip which can also have composite and S-video
at same time.

Nope, designing the hardware is relatively easy, and this way you get
the same product for everyone. Of course it's not usually as cheap.

> I get your point but what happens if Philips drop that chip from their
> range, same problem. Today I went searching for some info on pci cards

In our case it doesn't matter, as Philips have newer chips with
different capabilities (like OTG) which are compatible on many levels.

> If there are no known pci cards using the same chipset, could one
> be built ?

The problem with PC PCI cards is that many chips are difficult to
identify. The mfrs do this on purpose of course.

> >Oh, and what's a Milan?
>
> They're the people that built TOS computers after Atari ;-)

I was alluding to the fact that not many people had the opportunity to
own one, including me.

# 461. MI5 Persecution: Troubling Censorship Issues 20/8/95 (3039)

Fred Read (postmaster@foxhouse.demon.co.uk) wrote:

: He posts this drivel every week or so to a number of groups that
: I subscribe to and nothing seems to stop him. *ALL* of his posts
: are off topic and unwelcome to the groups he posts to.

: We have complained about him to his postmaster on at least four
: previous occasions and he still posts the same crap. As his SP
: seem unwilling, or unable, to do anything about him, we were
: windering if there was anything you could do?

If he is not actively using tactics to avoid or sabotage killfiles
(posting from various systems, forging, massive crossposting to create
cross-newsgroup flame wars) then it should be quite easy to killfile
him.

It does seem that the frequency and the size of his posts are
approaching net abuse. However, IMHO, they aren't quite there yet. If
his postmaster were to act in this instance, it would raise troubling
censorship issues.

The "#_SHL"-Line in the MAGX.INF (usally in C:\) defines the application,
which is used as desktop.

> corner of the screen.

I don't know why but it make the follow things:

-------------------------------cut-------------------------------
wind_calc(WC_BORDER, kind = NAME|CLOSER|MOVER, x = 552, y = 361,
w = 176, h = 320)
>wind_calc=> ok = 1, x = 0, y = 0, w = 18, h = 32
wind_create(kind = NAME|CLOSER|MOVER, max_x = 0, max_y = 0,
max_w = 18, max_h = 32)
-------------------------------cut-------------------------------

Maybe there is a problem in the binding.

Gerhard

Staring today and until 5-1-07 the following items have been
discounted by 5% at the Video Game Summit Section of the AVC news
stand:

Tote Bag
All Buttons(normal and mini)
Mini Button (10 pack)
All Stickers(Bumper,Rectrange and Oval)
Mug

After May 1st, these items will be removed fro the shop.(Also in the
coming months new items will be added to the Jagfest section as well
as the AVC section as well(Women dark shirts have been added already
to all three sections) be sure to check out the News Stand cover page
for featued items: http://avc.atari-users.net/index_files/newsstand.html
or just go to http://www.cafepress.com/avcnews for everything else.

Thanks a lot!
I think it runs now on most of systems:
- Mint + MyAES
- Mint + XaAES
- MagiC 6.2 + Thing
- MagiC 5.02 + Thing
- MagicPC/Wine
- Mint + MultiTOS
- Single TOS

Thanks everyone for helping me. Most of the problems didn't come from
SUDOKU itself but from the FORTH language I'm using. I had to repair and
make stronger the WinDial library I wrote for it long time ago when only
MultiTOS and TOS were available. That's a good thing done.

So, create and solve your puzzles now!

Guillaume.

Well, there is more program which can perform 25fps at fullscreen.
For instance Cyber Paint produces such files with extension SEQ. But
as I saw, those programs work so that they first decompress whole anim
in RAM and then run animation. So, it is very limited in duration,
even with 4MB RAM. It is even possible to play continous simpler
animations directly from disk, with deltaframes (what such programs
use for getting smaller files) - if there is no much change between
frames.
But for displaying movies or some MTV clips, it is not suitable. There
is too much change between frames, and poor ST with 8MHz CPU can not
load from disk, decode and write to video RAM enough fast. So, only
way is to read prepared frames fast from drive directly to video RAM.

Btw. you can check most of software with some Atari ST emulator -
Steem, Hatari.

Thanks a lot everyone.
I uploaded the Sudoku V1.00 on the belgian ftp-server.
Someone suggested that the program could save an IMG image of the puzzle
to be printed. A good idea I think.

Don't know who reported that SUDOKU was "eating" the whole RAM
available: that was true but I fixed that too.

Guillaume.

Foppy will soon distinct from PCs. Most of people does not use it at all. Pen drives, Flash cards, hard disk are very cheap now.
Unfortunately, it is not enough. 22 year old design of Atari ST is not well suited for USB, IDE.
ACSI port was never standard, and is used practically only with SCSI drives. But such drives are not so common.
IDE is most common, and no doubt, easiest to make such interface. But Atari ST has not bus expansion port (except Mega ST serie) . It is serious flaw, and Amiga has much more add on cards, because it has expansion bus.

People likes mostly ACSI interfaces - normally. they are easiest to attach. But what I see now? There is started development of diverse mass storage interfaces for ACSI port, but I don't see that any is finished or available at moment. As I see, developers want full compability, and it makes things very hard. They want that HDDRIVER and it's partition program run flawless with interfaces.
Oon the other side, it looks that USB/ethernal adapter is finished (for cartridge port). Question is how (fast) drivers will be made for it.
It's little ironic that there is a lot of interfaces for 8-bit machines - many CF card, IDE adapter for instance.
Lack of expansion bus looks for me as serious flaw now (although it is not problem for me to solder in machine).
We will see what near future will bring...

## 486. Speed up MagiC boot

Newsgroup: comp.sys.atari.st
Date: 2007-03-01 17:59:47 UTC
From: Guillaume Tello <houten.van@wanadoo.fr>
Message-ID: <45e71492$0$5093$ba4acef3@news.orange.fr>
Source record: 5999

Hi,

I made long ago a modification to MAGIC.RAM (version 5.02) to speed it up at boot time. The same can be done with MAGIC.RAM version 6.2.

My modification skips the floppy detection/boot as it's the big waste of time when booting and that, this is yet done by TOS before launching Magic.

in MAGIC.RAM at offset $1DBA (6.2) or $1A3C (5.02) you can find (in hexa):
2078 047a 4e90 4a40 6606 2078 04c6 (followed by 4e90 4e75)

replace with:
31fc 000x 04a6 0038 0003 04c5 4e75 (followed by 4e90 4e75)

"x" stands for the number of physical drives you have, 1 for A: or 2 for both A: and B:.

and you'll gain some precious seconds. Take a chronometer, you'll see!

Guillaume.

Nice work!

If you can work this idea up into some sort of patching program, it
would make it available to those who don't want to get involved with
sector editing.

I will be glad to host such a utility on my web site.

## 500. Mass storage interface for cartridge port

Newsgroup: comp.sys.atari.st
Date: 2007-03-05 14:26:12 UTC
From: ppera@ppest.org
Message-ID: <1173104772.496778.230930@8g2000cwh.googlegroups.com>
Source record: 6014

Such IF is already made for ST, and is called Paskud. As I know it
is not available more (except second-hand).

Do people wants still such thing or prefer ACSI port based IF ?

Some arguments: Cartridge IF can load driver from it's ROM chips, so
no need to boot from hard disk - and it means that can read DOS disks
without loading special driver from floppy.
It can be very fast - faster than ACSI solutions - up to 1.5 MBytes/
sec in read and in write (yes). Due to hardware L/H byteswap it will
read DOS disks and CD/DVD at same speed as Atari partitions (IDE IF
reads CDs slowly).
There is place for some additional short utils in cartridge ROM - may
put there some Timeset and other utilities.

Contra argument may be: not works with 'regular' drivers as HDDRIVER,
AHDI. It needs own driver and partitioning SW. Or may do partitioning
on some PC... (latest is not contra argument in most cases :-) )

Of course Cartridge IF means that no need to do any mods in ST. Just
attach and run.

PP

ppera@ppest.org wrote:

> Contra argument may be: not works with 'regular' drivers as HDDRIVER,
> AHDI. It needs own driver and partitioning SW. Or may do partitioning

Not necessarily. Writing a SCSI driver plugin (the SCSI driver
documentation is also available in English if I am not mistaken) ensures
that

1. It automatically works with HDDRIVER and any other software that
profits from SCSI driver support
2. No special partitioning software is required due to 1.

So writing a SCSI driver plugin instead of some other driver is the most
flexible solution. The SCSI driver for the Milan's SCSI bus is a good
example for the benefits provided by this solution.

Good idea, everything incorporated in one package - plug-and-play on
the ST!! :)
```

Well, I have my driver for standard AHDI IDE IF. It needs just small
modifications. In any case, for me it is easier than starting with
some plug-in.
Other thing is speed - plugin will certainly work slower than direct
solution. Hddriver is pretty fast, no doubt, but access time is not
too good with it - it adds whole millisecond to sector access. It may
sound as bad joke, but in era of cheap Flash cards access time is
really good (under 1ms). Actually access+reading of 1 sector time.
And maybe I want to get some money with launching partitioning
SW :-)

No, it will not be slower. Regardless of the media you are reading from
or writing to one or two subroutine calls (and even much more) do not
result in any measurable loss of speed. The actual I/O is always the
limiting factor.
You do not have control anyway over the applications which are reading
or writing the data. The time most applications (even if they are well
optimized) need to prepare the data to be written is much more important
than the question whether the driver writing the data needs one or two
subroutine calls.

> too good with it - it adds whole millisecond to sector access. It may

One millisecond is a lot for a CPU, and I doubt any driver will waste
this much time. Drivers do not need milliseconds to do their work,
unless a hardware protocol forces them to wait.

It is result of measurement with 320 times repeated random seek and
200Hz timer. So, it is accurate in range of at least 1% (but I
displayed only tenth of 'average' milliseconds ).

http://www.ppest.org/atari/astide.php

I did not put there which drivers are used, but you will figure out -
another one was AHDI 6.03
Obviously hardware protocol not forced direct HW access to be over
1ms .

I'd have to politely disagree here. I've tried most if not all, of
the current crop of emulators, and while they do a good job, they still do
not and can not, replace the original hardware completely, IMHO.

The experience is just not the same either. (especially if you're having
to run Windows to run some emulator - takes away the spirit of it all
completely!) :)

To the original poster, a 1 meg 1040 would probably be the most compatible
and run the most ST software across the board. If you can get a STe
(enhanced) though, they surely are a lot of fun. :)

> I did not put there which drivers are used, but you will figure out -
> another one was AHDI 6.03
> Obviously hardware protocol not forced direct HW access to be over

I once knew the IDE code used by AHDI quite well, and I cannot remember
AHDI (and would not expect) any other driver to wait for milliseconds if
it does not have to.
As far as HDDRIVER is concerned it waits according to the signals driven
by the drives and/or mandated by the low level protocol specifications.
Except for one exception: There is a special option for drives connected
to the ACSI bus, because with ACSI the drives cannot control the bus
protocol as they do particularly with SCSI. With this option some drives
are considerably slower (compared with AHDI), but other drives do not
work at all. Well, this can be the result of a timing too overly optimistic.
If I have the choice I prefer drivers that comply to the specifications
and thus provide highest compatibility and reliability to drivers that
ignore the specification and may or may not work, risking a loss of data.

A general remark related to IDE: Implementing a SCSI driver plugin means
that third-party software can make use of your IDE hardware out of the
box. ATAPI CD-ROM or CD/DVD-writer software, for instance. And provided
that XHDI is implemented on top of the SCSI driver interface software
like MiNT, which profits from this interface, will also run out of the box.
Implementing existing software interfaces from scratch instead of using
implementations that have been known to work for years bears the risk of
imcompatibilities. And it takes much more time than just implementing
what is actually needed.

For completeness of information, the latest version of Diamond Edge
supports partitioning with FAT partitions, but:
. it doesn't support FAT32
. it requires SCSIDRV support for raw I/O, and since the best SCSIDRV
support is with HDDRIVER ...

The partitioning support was inherited from earlier versions of Edge,
which did their own raw i/o to disk, but I dropped that for a number of
reasons.

However, if you have one of the free SCSIDRV implementations, you
*could* do partitioning without HDDRIVER.

You are right about CD/DVD support. I don't think to support TT or
Falcon (it has no sense at all).
Writing CD on ST(E) is possible, but it is too much for old machine.
DVD is not possible because of low bus speed, low hard disk capacity.
We will see it... There are some things fot testing yet.
I don't think that ST is nowadays suitable for some serious work. It
is nostalgia machine, and many of them is still in good shape, so
people may sometimes turn it on and play something and look how nice
was that First Word...
Flash memory is very cheap now, so why not using it?

Don't get me started ;-)
I run a mailing list for around 200 members still using Notator SL on
their trusty old Atari STs. These are both hobby and professional
musicians.
MIDI timing is rock solid on an ST, and for MIDI sequencing they're
still no. 1 in my book! :-)

So I disagree with the above as well. It all depends what you mean by
"serious work".

I'm surprised nobody has suggested a battery-backed realtime clock for the ST.
Why Atari left this out to begin with can only be described as a design flaw.

When I used an STe I bought a clock board which IIRC plugged into one of the ROM sockets and possibly also soldered a wire or two to the motherboard somewhere.
I believe Hard & Soft in Germany made them.

With my Mega STe however the clock came built-in, so Atari must have learnt something along the way ;-)

In conclusion I think a clock-board would be of benefit to just about every Atari ST owner out there (who likes to set the clock every time they boot up the machine?).
There have been some DIY projects for this here and there, but not really a complete and fully documented project.

Hallvard

Actually, I myself do sometimes some 'serious' things on ST - as
GAL, EPROM, FLASH programming. Or programming SW for ST. But I have
already hard disk. Same is with practically all other serious users -
all they have already hard disks and other peripherals. I thinked
considering possible market for new interface.
From same reason Seimet's reasoning about some 32-bit compability has
not much sense - Falcon and TT have built in hard disk interfaces, so
they will not buy it.
```

Yep, my Mega ST4 certainly does. :)

So Atari got that part right with:

Mega ST
TT030
Mega STe
Falcon

but left out all the others...I can understand the original 520s and
1040s, but everything after the Mega ST started it, should have had it as
well. Just my humble opinion.

On my 1040 STf I had an external clock which plugged into the romcartridge
port. It was called "Forget-Me-Clock II" and worked in combination with a
little AUTO folder program. Worked fine, except that the software had
Y2K bug. Which I fixed with another AUTO folder program :-)

Yeah, I know about those cartidge based clocks, but I'm not
particularly fond of things that plug in there as it's a mechanically/
electrically bad solution, meaning that you might end up with a
"forget me not" clock instead ;-)
Every now and then members of my Notator mailing list complain about
the program crashing etc. and in just about all the cases it turns out
that the copy-protection dongle that goes into the cartridge port has
either oxydized or gotten dirt on the contacts, or I believe in some
cases the electrical contact is bad because of bent pins.

Such a solution also means that you're not very likely to put anything
else in the cartridge port (unless you want a long chain of devices
such as in my case with 4 cartridge devices!).

It's been a while since I had a look inside my STe, but IIRC it was a
pretty simple circuit, basically with a single clock chip (by Ricoh?)
and perhaps a resistor and capacitor, and of course the battery. Mine
came with a battery holder for 2x AA batteries, but I thought that
seemed a bit old fashioned and clumsy, so I etched a PCB and soldered
in a holder for a 3V clock battery instead (no pun intended).
I think something like that could easily be made by someone into DIY
electronics, and probably sold quite a few -at least to those who use
their Ataris daily, or want to date-stamp their files correctly.
The only downside for a lot of people is that they need to take their
STs apart, and in some cases might even need to unsolder the TOS ROMs
if they're not socketed (alternatively solder the clock PCB's socket
on top of the TOS ROM chip).
For those who can't do that kind of stuff themselves they could have
someone into electronics locally do it for them. Shouldn't be hard.

Perhaps an idea for those who are designing and selling add-on
hardware for the ST?

I gather from the guy I bought it off it was a very early one, and that he
installed the blitter later. I guess it mighyt have a DSDD drive and he just
bought this so he had two. However I also have a couple of "home brew"
external units that have have 3.5" & 5" switchable drives, so its not a real
loss.

Writing to DVD on ST(e) is already supported by our software. It
requires a Link96/97 host adapter plus a SCSI-to-IDE converter, so it
may not be *practical*, but it is *possible* :-).

# 533. Networking under MagiCMac

Newsgroup: comp.sys.atari.st
Date: 2007-03-08 01:50:43 UTC
From: FMH <fmhcentral@gmail.com>
Message-ID: <45ef39a5$1_3@newsfeed.slurp.net>
Source record: 6047

Hello,
I have the bug to start messing around with my Atari software again. I donï¿½t have the space at the moment to setup my TT so this leaves me with emulation on my Mac. Years ago I ran MagiCMac 1.2.5 on a Powerbook 165 and life was good. I still have MagiCMac 1.2.5 but that only runs under Mac OSX 7.X and I have OS 9.22 and OSX 10.4.8 running on my G4 Cube. I run OSX 98% of the time on it. I downloaded the OS9 and OSX demos of MagiCMac and have each one running OK on my machine. Stinks that they only run for 15 minutes before terminating but it is at least giving me a feel of how each runs on my machine and MagiC really runs great so far. I remember reading years ago about MagiCMac under OS9 being able to use the Macï¿½s built in TCP/IP stack and Ethernet card. This allowed Cab, FTP programs E-mail, Chat, or whatever to use the Macï¿½s high speed Internet connection. Problem is I have not been able to find any documentation or configuration files on how to do this. It may be something very simple and obvious in the MagiCMac setup but since the demos and included documentation are in German I have not been able to figure it out. Does anyone know how to configure MagiCMac to use Mac OS TCP/IP and network card? If I can get it working under the demo version then I would be more inclined to spend the money to get the real deal. When researching how to do this I ran across some statements on the Web that ARAnyM claims to be able to do this also. I have not tried ARAnyM in many years and I did not recall this feature back then. Is this built in and automatic or is there anything special that needs to be done to get to be able to use your host OS networking under ARAnyM?

Simple calculation says: 1x DVD speed requires about 1350KB/sec
datarate. It is on limit of regular interfaces. And reading from hard
disk is not included in that...
So: only if that Link 96/97 adapter can simultaneous read from hard
disk and write to DVD..
Or DVD writer will make lot of revovers from buffer underrun. Disk
will be written much slower, but will be readable.
I had such situation once when dumb XP turned off DMA. Disk is
perfectry readable, but I don't like it.
Beside it, I don't like ACSI-SCSI-IDE chain... 2 adaptor costs
certainly more than IDE DVD writer.

Sorry, I was not clear. I meant compability with 32-bit Ataris.
However, making FAT32 support for TOS could be useful...
Biggest problem now is how to partition large disks. I talk here
mostly in ST(e) sphere.
But FAT32 could be fine for Falcon and TT if people don't want to
bother with Mint and
other...

I made it long time ago. It was compatible with Mega ST - same chip
on same address.
But later I used ST so rare that battery went dead. And RTC modul was
on bad place when I started to make IDE IF, so I removed it! And it
stays out of machine still. I have now Mega ST, but don't see too much
use of RTC because I develop ST code on PC.
If you send me a beer I can post project for RTC... :-)

I would imagine IF he could be talked into it he would be reasonable and
the rate would be close to what the Falcon version would be.

This list is first to prove that yes, there are 50 TT users interested.

I have been told that he does not have a TT 030 to develop with. I say
here and now I will work with him to ship him mine to make this happen.

Thanks for your response on this. (I'll jot you down as interested.)

IIRC Andreas Kromke mentioned that an XCMD module would have to be
written to allow this.

I see that I have translations of some of the docs that came with
MagicMacX - I must get these online at some point.

You mean you are going to write a TOS plugin or something like that,
which supports FAT32? I do not think this is a good idea, because MiNT
and MagiC already support this.
And a plugin might slow down the Atari 1 or 2 ms when reading data ;-).

Of course it will be slow, but does it really matter? It's still better
than not being able to write DVDs at all. By the way, even the TT and
(unmodified) Falcon are not able to transfer 2x1350 KB/s.

> Beside it, I don't like ACSI-SCSI-IDE chain... 2 adaptor costs
> certainly more than IDE DVD writer.

Remember that in order to connect ATAPI DVD writers to the ST one needs
an IDE adapter and a driver supporting ATAPI devices. An IDE only driver
will not work.

I would of course be interested, and maybe someone in my neighbourhood too,
but I must add that :
1- accelerator + FAST-RAM is good, but - except those owning a graphics card -
most TT owners must satisfy with 640x480x16 :-(
So, why not add the ability to plug a PCI or AGP graphics card ?
And Ethernet / USB too...
Why only satisfy with half the job ?
2- Rodolphe is already working on CTPCI, which I'm afraid won't be ready before
long, so I guess a board for TT won't be done (if any day) before at least
2 or 3 years :-(
We are used to very long delays with H/W projects - for instance, I paid for
2 EtherNat more than 16 months ago, that I hope I'll receive one day - but
even if we know it's normal for small quantities production, don't forget
our machines aren't eternal... as well as people - the man I wrote about in
the 1st line is over 80, and though he would be very happy to use his TT
with his LCD monitor, he might not live old enough to see the project
achieve :-(
3- very important... the price! this ought to be sensitive...

How to put 4.7 GB on FAT16 partition?
I said that don't like that write will be interrupted zillion times.
Today every kid has burner in his PC, so I don't think that ' not
beeing able to write DVD' case will happen.

I konw that at one stage many years ago I put up my hand to indicate
interest. Eventually I bought a CT63 and a Falcon to go with it. I
don't know whether my name made it onto this particular list but I am
still interested so, if not, please add it.

Well today I stumbled upon this ASH sold/supplied? a program called
MACSTIP that does what I am after. Google/Yahoo/favorite search engines
turn up almost nothing at all about this program. I've never heard
about this program before as I am sure most of you have not either
unless you were a MagiCMac user when it was released and you actually
used it.

Also I read bits and pieces translated from German or French about a
program called ICAT that sounds like it may do the same thing. I have a
web page translated on this printed out and will have to study it closer
to see if in fact this will do what I am after.

# 555. [ANN] CAF49FIX A Patch For Cubase Audio Falcon

Newsgroup: comp.sys.atari.st
Date: 2007-03-09 13:31:12 UTC
From: DOCs <"docs ifrance.com">
Message-ID: <45f161a9$0$28816$426a34cc@news.free.fr>
Source record: 5968

Friday, March 9th 2007,

CAF49FIX is an old patch never released ( I don't
remember exactly why... ). I think it's always
useful so good luck !

http://doyeuxyvan.free.fr/caf49fix/0.9/CAF49FIX.PRG
http://doyeuxyvan.free.fr/caf49fix/0.9/CAF49FIX.ZIP

```
-------------------------------------------
- CAF49FIX (beta version 0.9) by DOCs (2003) -
-------------------------------------------
```

This patch allows Cubase Audio to work with
the Falcon's 49170 Hz frequency !

The 49170 Hz frequency is REALLY saved by Cubase !

The original Cubase program file is packed by
the PFX packer. You must unpack the program file
( with NDP for example ) before using this patch !

CAUTION !
Save your original Cubase program file before
using this patch !

Only Cubase Audio v1.0 & v2.06 are supported.

Thanks to THE REPLICANTS, all ATARI community.

If you need NDP to unpack your Cubase program file:
http://doyeuxyvan.free.fr/caf49fix/0.9/NDP/

## 556. Emulator question(s)

Newsgroup: comp.sys.atari.st
Date: 2007-03-09 14:45:51 UTC
From: aonemag@gmail.com
Message-ID: <1173451551.516940.108610@t69g2000cwt.googlegroups.com>
Source record: 5969

I received the following message from an Atari user of yore,
pertaining to emulator isses and potential for some present needs. I
have suggested that she check here and ask specific questions, but for
now, I told her that I would put here message out here because this is
probably the best place for her to get answers and.or suggestions.
Thanks!

-Dana @ A-ONE

HI Dana-

Hope you are doing well.

It's me Jen Larkin. You may remember me. My dad (John Larkin) and I
were members of SSAG a *long* time ago. For perspective, I remember
talking on the BBS's and coming to the meetings at age 13, back...

I came to the Delphi forum looking to see if there were any Atari
people still kicking around, because I have some emulator questions.

In modern times, I use a G4 ibook for graphics design work. I actually
have my own online business - Designs by Jen L - http://www.cafepress.com/lovejml.
This venture requires high resolution
graphics, so I do my designing in Photoshop. However, I'm finding I
need to rediscover Degas Elite, Spectrum 512 and Crackart, because
they provide better relative functionality than Photoshop offers
in either CYMK or index mode, and I feel I will design with more
precision and attention to detail if I am forced to adhere to the very
strict color management offered in the old ST programs.

Anyway, I used to have NoSTalgia running decently on an indigo ibook a
few years ago, but it doesn't seem to like OS X 10.3.9. I've tried
running both Hatari and Aranym (sp?) with EmuTOS, which is
abysmal version of TOS by the way, to no real avail. I came by looking
to see if there was anyone out there who could advise me on
configuring one of these emulators, or if there is another solution
that I'm missing (OpenGEM perhaps?). Unfortunately, support for the
various emulators has dropped off astronomically in the last couple of
years. I e-mailed the creator of Nostalgia two months ago
asking how to make Nostalgia run emuTOS without bombing, and how to
make it access the hard drive (easily done under OS 10.2.8). No
response. Not even an auto bounce!

Unfortunately, I have none of my old hardware. Regrettably, the bulk
of it was sold or given away 9 years ago, when my father passed away.
The only vestiges of my ST ownership are a few old manuals (GFA basic
and Tigercub!) that I found in my mother's basement, which I now keep

for purely sentimental reasons.

So if you are still an Atari enthusiast, and can help me out, or at least point me in the direction of someone who can I'd greatly appreciate it.

Thanks in advance, and take care.

Emutos is in very early stage, and it may happen that will be never
finished, as many of too ambitious projects around. Hatari is under
active development, and you may try to use it with some of official
TOS (1.62 for STE). Just look around, and you will find it on WEB. I
don't know something better for MAC.Usage of hard disk inside emulator
is solved pretty good - you can map some of your local directories as
partition for emulated Atari and/or using image file of some drive -
there is sample image for download on Hatari WEBsite. Everything is
configurable via config menu.

For OSX.3.9 working version of MacAranym, you may appreciate the
usage of the preconfigured mini pack that is located on my site.

Please have a look at <http://eureka.atari.org/MacAranym.zip> that
I do my best to keep up to date. Your remarks are welcome. You can
always ask questions on ARAnyM's users list <http://aranym.org/>

I personally own a dual-G4@1.25GHz running OSX.3.9 and MacAranym.

Best regards,

Hi,

Just a thought: isn't it possible to make a simple CT60 to TT adaptor? Isn't there a kind of compatibility beteween the signals found in the Falcon and those in the TT ? (Ram, 68030, etc...)

This way, no CTT to design and produce.

Guillaume.

## 560. Re: Emulator question(s)

Hi,

The current version of NoSTalgia now runs on Mac OS X. You can get it at http://users.skynet.be/sky39147/ and it's your best bet for running low rez ST art programs.

MacAranym is better suited for running GEM stuff only since it uses FreeMINT (EmuTOS is just to get MiNT going). You can also run Hatari using a real TOS image, though I never actually tried it.

Hope this helps...

Thanks everyone for your suggestions. I do have some regular TOS images. If I remember correctly, "Rainbow" TOS (1.4) was the one that seemed to be the most stable with older software - at least on my old hardware - so that's what I will try first.

Mr Maddog:

I recently downloaded NoSTalgia 1.42. Made the HDD_C file as instructed, but I can't get it to recognize my hard drive no matter what I do. Any ideas?

Thanks again for your suggestions and help,

-Jen L.

>
> However, if you have one of the free SCSIDRV implementations, you
> *could* do partitioning without HDDRIVER.

Thanks. All this is too complicated, and too much 'if' .
But, I'm now only few steps from partitioning SW for GemDOS :

http://www.ppest.org/zx/drimus.php

I just added code for recreating partition table in case of damaged
boot-sector. It works extremely fast, and will restore table always
when partitions self are intact. From that is needed only: adding some
dialog where partitions can be set, and code for doing it properly. It
is of course not exactly what Atari people wants - but may be helpful
in times of removable drives and card readers.
How autoboot will be solved depends from drivers, installers.

I've posted onto Jaguar Sector II (http://jaysmith2000.ipbhost.com/) and
Atari Age (http://www.atariage.com/) info about auctions being conducted by
B&C (www.myatari.com) on behalf of John Skruch.

Here's a link to the Atari Age site posting about the auctions where you can
find links for more info.
http://www.atariage.com/forums/index.php?showtopic=103426

Enjoy.

> The experience is just not the same either. (especially if you're having
> to run Windows to run some emulator - takes away the spirit of it all
> completely!) :)

Of course it isn't the same experience. But try to imagine experience of using some new Atari models, if Atari computers comes back to market. It can't be the same. It wasn't the same comparaing ST to XL. Things are changing. But, I just want to say, it's the easiest way especially for playing old games. And Steem is really great emulator, much best then I was think it's possible.

## 571. [ANN] MintNet driver for SCSI/Link

Newsgroup: comp.sys.atari.st
Date: 2007-03-12 04:12:27 UTC
From: Roger Burrows <sergeantvimes@yahoo.ca>

A freeware MintNet driver for the Daynaport SCSI/Link is now available.
This is the first public beta, so please watch out for and report any
bugs ;-) You can download it from the following URL:
http://www.anodynesoftware.com/ethernet/main.htm

Roger Burrows
Anodyne Software

Hehe... the cost for sending you that can of beer will probably cost
far more than the beer itself ;-)
I found yet another clock project here with a schematic and data-file
for programming a GAL chip:
http://www.asamnet.de/~hilgarte/uhr.php
(the clock-board in my STe has no GAL as far as I remember, so why
this is needed is beyond me).
However, there's no ready-to-use PCB layout with that project either.

## 574. Ethernet solutions (overview)

Newsgroup: comp.sys.atari.st
Date: 2007-03-12 08:32:04 UTC
From: SixteenThirtytwo <sixteen_thirtytwo@yahoo.com>
Message-ID: <1173688324.703972.204680@v33g2000cwv.googlegroups.com>
Source record: 5988

All this talk about Ethernet for the ST has gotten me curious and
wondering if I could add something like that for my recased Mega STe.
So far I've found the following:

- various VME boards made specifically for the Mega STe: either near-
impossible to find, too expensive or don't work well.

- NetUSBee (http://hardware.atari.org/netusbee/netus.htm) USB and
networking in one plug-in card and apparently also available! Sounds
promising, but in my case I'd rather not plug anything more into my
already over-filled cartridge port.

- various cartridge adapter solutions: superceeded by NetUSBee as far
as I know and no longer available

- Daynaport SCSI networking adapter (http://www.anodynesoftware.com/
ethernet/main.htm): sounds promising as well, but since I'm not sure
if I will attach any other SCSI devices permanently to my Link 97 and
this solution needs that I don't know if this is for me.

- EtherNEA
software: http://home.arcor.de/thomas.redelberger/prj/atari/etherne/index.htm
hardware: http://www.asamnet.de/~hilgarte/
This solution seems to use the ACSI port (not SCSI) which I hope has a
"thru" port which will allow me to plug my Link 97 into and get SCSI
for hard drives etc.
Apparently it's an adapter which allows for a standard PC Networking
card to be plugged in.
Doesn't seem to be readily available though.

- Ethernet adapter II (http://www.asamnet.de/~hilgarte/). Another ACSI
port adapter. But it doesn't seem to have a "thru" connector either. I
also don't know if it's available any longer

Anything else I can use?
Preferrably something that connects inside the machine (I don't mind
soldering or even making the whole card myself just as long as I don't
have to design it myself!), or to the ACSI port (with a "thru" port!)
or through an SCSI adapter such as the Link 97. As I said earlier, I
don't think using the cartridge port is suitable in my case as I
already have 4 devices there.
By the way, it has to work with TOS 2.06 as well as MagiC.

I like the look of the STlabs board.

Anyone have an idea on ETA or approx price.

I'll definitely have one. I think it can be used externally or
internally. I'd personally get the external model.

It is exactly same project as in CT. And there IS a GAL in my Mega ST
(so, likely in your too).
It can be solved without, but probably instead 1 GAL some 3-4 TTL
chips.

> However, there's no ready-to-use PCB layout with that project either.

A chance for you to make it (and publish) :-)

> What are the best sources for ST software/games?

Any ST will do the job, but STE is more advanced and will run SW
what bare ST can not.

Your LCD VGA monitor should display Atari's monochrome mode. Only need
very simple, passive adapter - Atari's 13-pin to 15 pin VGA. No dvi
access. of course.

For color modes regular TV card may be a cheap solution. Otherwise it
requires some not so common monitors.

SW for ST? Hmm... it requires some search, visit some Atari forums...

A few weeks ago I posted a message about the Registrar I use having
serious issues, which I also used as my DNS system. (search Slashdot
for registerfly or visit registerflies.com) This has caused me to
lose 2 domains and some outages with the DNS. I'm in the process of
moving to a new Registrar and DNS system. Things I hope will be back
to normal by the end of the week. This includes ataricq.org,
atariforums.com and atariforge.org.
Atariforge.net has already been moved. Sparemint.org and Gemcandy.org
are in limbo right now.

Almost forgot, for the HighWire site, try http://highwire.atariforge.org
(or .net)

I just read something very interesting about the Mega STe built-in
SCSI at the Atari STe fan-page (http://atari-ste.anvil-soft.com/html/
devdocu6.htm) where it says:
---
? The TT features quite a complex SCSI subsystem but i cannot find any
information of the Mega STE's SCSI subsystem ?

! That is simply because the Mega STE does not have a SCSI
subsystem. If your Mega STE is equipped with an internal SCSI
harddisk, it has an internal SCSI hostadapter that is mounted on an
internal ACSI-bus. Hence, the Mega STE sees your harddisk as ACSI, not
as SCSI and can also not directly access the SCSI controller on it.
---

In other words: this would be perfect for that ACSI ethernet adapter,
wouldn't it?
Then I could use the Link 97 for everything else (hard-drives, CD-ROM
etc.)

Currently I look for PCB manufacturer. There is yet lot of work to
do with drivers and partitioning software.
May be available in some 3 months from now. Price would be about 40
Euro - that includes interface with 2 Eproms (with hard disk drivers
and probably couple short utils, just to fill space) + Partitioning SW
(it is not wise to put it in Eproms, even if would fit there).
And I need to know what connector people prefer - IDE or Compact
Flash? I will put some formular on site about it..
Personally I recommend CF...

Is there a way to plug more than one thing into the cartridge port? I have a Cubase Audio dongle on my Falcon that's inside my recasing job, so I'm not able to use any other cartridge port devices (like NetUSBee, etc.) in any practical way. Something that allows more than one item to be plugged in would be very helpful, if it exists.

By far the biggest problem is getting the connectors for the cartridge port. 2mm pitch.

Isn't necessary! STip v1.0 starts from the AUTO folder and you must
start MacSTip v0.9d manually at the Mac side - after that ICONNECT
can now connect via the Mac OS TCP/IP network... that's all!

Yes, for dongle based programs such as Cubase as you mention (and
Notator SL in my case) there are cartridge expansion devices available
(or were available I should say), but they only allow you to select
one cartridge device at a time.
These devices were made for situations where you have several dongle
based programs and you don't want to switch off the computer in order
to change dongles, then power up again.

The device in question really needs a "through" connector so that
another cartridge device can be plugged into it and be accessed at any
time.
This is what my C-Lab/Emagic hardware add-on devices have.

That's true.
I'm looking for them as well, but haven't had any success so far.
I believe Foxconn made them back in the days. I've found their website
(http://www.foxconn.com/), but unfortunately no such connector is
found there. I've tried contacting them, but haven't received any
replies. Maybe you should try as well.

Hello,

An update to the SUDOKU solver: it can save the puzzle as a GEM IMG file to be printed (Button SAVE, then GEM IMG).

http://perso.orange.fr/gtello/downld_e.htm#prog

With sources (it's open...). The IMG image is 1200x1320 mono. So, if you print it in 4"wide, it's close to 300 DPI.

Enjoy,

Guillaume.

Great! I never go online and use Cubase at the same time, so switching between an Ethernet device and Cubase dongle shouldn't be an issue. Do you have the name of this cartridge expansion device so I could track one down? Or, does anyone out there have one they want to get rid of?

Thanks for the info!

I don't have one for sale or know anyone else who has, but who knows
what fellow Atari users have in their closets (or ex-Atari users).
Since I use Notator I've bought C-Lab/Emagic's "Combiner":
http://www.notator.org/html/notator_faq.html#combiner

Then there's the Cartmaster from Wizztronics:
http://www.notator.org/html/notator_faq.html#cartmaster
(According to their website they seem to have a "low cost" (ehm.... at
US$ 80 I'm not sure if I agree) version of the above called the
Cartmaster lite, though I'm not sure if it has a "pass-through"
connector which you really should have for your Networking interface:
http://www.wizztronics.com/cartmast.htm)

>From Steinberg there's the Midex and Midex+ as far as I know. Since
you use Cubase this might be your best bet for compatibility as if
Cubase is something similar to Notator it automatically changes to the
correct dongle when within the SoftLink environment. It's M.ROS for
Cubase isn't it?
Anyway, you're in luck because there's a little over a day left for an
auctioned Midex+ at eBay Germany:
http://cgi.ebay.de/ws/eBayISAPI.dll?ViewItem&item=230102638286

If you don't get your hands on that one you could always set up an
automated search at eBay and get alerted whenever something like that
comes up. Also try to find ex-Atari users and places where people
would dump anything "worthless" (to them) meaning you might get a
bargain on stuff like this which within the Atari community is
probably worth a lot for those looking for them.

There are probably other cartridge devices around, but that's all I
can think of at the moment.

Upon further inspection I see that there are several Midex devices
available at the moment. So far only at eBay Germany:
http://search.ebay.de/midex_W0QQfkrZ1QQfromZR8

I don't know where in the world you are, but you could always try to
contact the sellers and ask them if they're willing to send to your
area as in my experience they often are even if the auction page says
they only send it within their own country.

I'd go for one of the Steinberg devices if I were you, to ensure full
compatibility. It's been a while so I don't know the details, but I'm
pretty sure the Midex+ has some advantages over the Midex. Perhaps
someone else can fill you in on that.

Good luck!

Actually, it is PAL in Mega ST.
So, STE integrated it... But then must have chip select pin for clock
chip on that GSTMCU. Should check schematic of STe...

Why is GAL (or PAL with same function) ? It is address decoder and
little logic - for activating clock chip on certain address, and give
some required signals to CPU - as DTACK.

AVC is returning to The Midwest Gaming Classic on June 9th and 10th to
host
The Atari Jaguar Festival (aka "Jagfest " to long time Atari
followers) section.
AVC has been involved with Jagfest since 1997 when the first Jagfest
was held
in Rosemont,IL and we enjoyed being part of the festivities in some
way or
form at other shows.
At last years show AVC produced a special black t-shirt to
commemorate
Jagfest 10th year anniversary. This year AVC continues the trend by
producing
four new items to celebrate Jagfest 10th year and they are:
Limited Edition Jagfest tour Shirt(based on tour shirts that music
bands
have. Front of the shirt has the Jagfest on tour Logo below that the
words
in RED "1997 to 2007" and "US To OverSeas" Back of the shirt has
a smaller version of logo below that also in RED are that all known
dates
and locations of Jagfest(US and overseas)) from 1997 to current)
Black Jagfest on tour cap
White Jagfest on tour cap
Jagfest on tour trucker cap
(all caps have the jagfest on tour logo below that are the words in
RED:
"1997 to 2007")

The Tour shirt (and two of three caps ) is scheduled to make it's
first appearance at
the Jagfest section at Midwest gaming classic, where AVC will be
selling a limted
supply of the Tour shirts and take orders for it after they sell out.
( we will be taking orders for the caps as well for any other Jagfest
On tour items)
AVC also announces a Tour Shirt and a selected Jagfest on tour cap
will be a prize
for this years Jagfest Tourney
All above mentioned items are currently on sale until August 1st then
thier prices will go up.
The Limted Edition Tour shirt will be removed from the shop after
Novemember 7th

(the caps will however remain in the shop) orders for the Jagfest on Tour items mentioned above can also be done online at <a href="http://www.cafepress.com/avcnews/1338959">Jagfest Section at AVC News stand on Cafepress.com</a>
For more information on Jagfest at Midwest Gaming Classic click <a href="http://www.midwestgamingclassic.com/content.php?id=jfest">here</a>

>
This sounds like a route.tab problem. Please post your route.tab file
for help or read on
(From a post of some years ago):

Let's not forget what the route means:
This is from memory, but I believe I'm correct:

First set: What addresses may be reached
Second set: Masking (0 = strip, 255 = keep)
Third set: What port to use
Fourth set: What gateway computer (router) to find

Thus, 192.168.0.0 255.255.255.0 Ethernet 0.0.0.0
would mean to send any data intended for 192.168.0.xxx out the
Ethernet
port and to use any available computer as the gateway.
Then 0.0.0.0 0.0.0.0 EtherNet 192.168.0.1
would mean to send any other data out the Ethernet port to the
computer
192.168.0.1 (assuming that's your router). If you intend to send all
data out
your Ethernet port, I think that you just need the default line, which
would be:

0.0.0.0 0.0.0.0 Ethernet 0.0.0.0

although you might also try:

192.168.0.0 255.255.255.0 Ethernet 192.168.0.1
0.0.0.0 0.0.0.0 Ethernet 0.0.0.0

One important point -- there are no spaces in this file! What appear
to be spaces MUST be double [TAB]s.

Galen

No. It's pin compatible (RS-422?), but there are no Appletalk
drivers. The easiest (rather slow) way to transfer a few files is to
email them to yourself. Send on the Mac. Receive on the STe.

So far unknown. This list is to show that there are 50 interested purchases should the developer of the Falcon CT60 reconsider development of a TT version as well. He said he couldn't find 50 interested people for the TT, I disagree. We have 40 so far, and this list has not been going all that long or circulated to all regions it could.

Cost, if convinced, I would imagine would not be much more than the Falcon version. How much was the Falcon version? (Could one of you CT60 Falcon users answer this question?) :)

Thanks for the interest.

43 Users. Seven more to go.

Spread the word to friends with TT030 computers. If we show there is an interest, it this could be done, it would be an incredible boost to the TT030. It's proved to work out well with the Falcon, I believe in the technical abilities of the CT60 developer, so I don't see why it wouldn't.

If you support and nothing happens, you did your part. If you support and something does happen, you can say "I helped make that happen." :)

Thanks!

According to Paypal, in 2004, I paid $396.00 for my CT60. That of course,
is with Paypals fee, the conversion charge, shipping/handling, etc,...

Hi,

Just bought an old Atari ST, with a shitload of discs.
Just powered up the beast, but the beast is a bit ill, it doesn't want
to read discs.
So, first conclusion, diskdrive failure. Is it possible to just add an
"normal" pc style discdrive?

Greeting, Ross.

Hello everyone,
Been quite some time since I posted here on the forum. But I
purchased the original CT60 from the first run and I got a 060 that
would run at 72 mhz which at the time was the fastest we could get.
Paid like 330 or so exchangerate was much better then. I then purchased
a 100 mhz 060 for slightly over 100 us dollars. Then I paid like 375
for a CT63 so I had a backup board or in case I wanted to make another
falcon scream. I also bought 2 Ethernat boards and 1 CTPCI board. But
hope this helps

Hi,

Another update, 1.03. Now the program can generate HARD puzzles.

http://perso.orange.fr/gtello/downld_e.htm#prog

In fact, each time a MEDIUM one is created, the program tries to convert it to a HARD one. Not always possible! (because there must be only one solution!). Let's say that 1 MEDIUM out of 5 is converted into HARD. It's written under the grid with the difficulty level.

Generating a HARD grid lasts between 0"98 and 1"68 on my TT and between 5"49 and 8"55 on the Mega STE (and around 0"03 with Aranym...).

That's it.

Guillaume.

(Answer in english here to match the forum, but as we're both french, I'll
post on fcsa in our native langage)
O-kay, here are statistics :
- easy-level grids generated in 0.01 second,
- generates medium-level grids within 0.12 to 0.19 second,
- hard-level ones take 0.16 to 0.18 second, and
- all levels grigs are solved in 0.00 second !
That is, on my FalCT60 running at 96 MHz and secondary clock at 50 MHz ;-)
So, maybe ought you to increase the accuracy of your count ;-)

> So, maybe ought you to increase the accuracy of your count ;-)

I use the system clock at 200 Hz. So, if the solution is found in less
than 0,005 s, it will be ZERO, that's what happens.

Using another Timer with interruptions (for example at 1000Hz for
milliseconds) would slow down the system, most of all on a Mega STE!

Another solution would be to play a blank DMA sound with a one second
buffer. Each time the end of the buffer is reached, an interruption happens
and you can count the seconds. Then, when the solution is found, reading the
pointer into the buffer would give a precision of 50000Hz without slowing
down the system.

But is it really worth it? And what about the machines without DMA
sound?

Thanks for your tests! Hope I'll have a "CTT"060 one day!

Guillaume.

## 631. Specialized Application Software Wanted

Newsgroup: comp.sys.atari.st
Date: 2007-03-18 18:28:15 UTC
From: Ed <lener@vt.edu>
Message-ID: <etk0df$j4r$1@solaris.cc.vt.edu>
Source record: 5945

Hello. I'm interested in purchasing copies of a few items I've seen advertised in old magazines but haven't been able to locate. Given their specialized nature I imagine most were sold in fairly small quantities.

Anyone have a copy of any of these they are not using and want to sell? If so please e-mail me (lener at vt.edu) Note - the numbers in brackets after some items below is the latest version I am aware of. Will also consider earlier versions of most items. Located in the US.

El Cal Calculator [2.3], Debonair Software
Hyperlink, JMG Software, - Need manual for version 2 and/or software 2.05 or higher
Recipe Box [5.0]. Mountain Software
Spelling Sentry, 1.1 or higher [1.2], A+D Softare
Spiritware Concordance [3.1], Missionware Software
Star Base [1.3] and Big Sky, Debonair Software
WinterTree Thesaurus, A+D Software

Cyber Design Disks - City I+II, Dinosaurs, Microbot, Woodlands, Vintage Aircraft (These were advertised in STart just before it went under, not sure if they were ever produced.)

Speaking of old Atari magazines, I have extras of many familiar titles - please contact me if interested.

# 632. NEW SERVICE... ATARI BBS GATEWAY!!

Newsgroup: comp.sys.atari.st

FamilyNet International Newsgate

A long time & stable Dallas BBS has offered to provide a "Favorites page" for
the Atari BBs users. Basically I provided a up to date BBS list of the active
Atari sites out there, and he created a place you can go to, bring up an Atari
telnet menu, and go to an Atari BBS. :)

Ever been curious to see the online world of Atari computers? Come check out
the Prison Board BBS:

972-329-0781 (this number good for people want to try out Atari modems,
and dialup means.)
216.62.20.217 (This IP number is great for Lantronix users, and has not
changed for a considerable time.)

Never has the online Atari world been so easy to access from your Atari
computer. Simply call up the above system, get to the main menu, X for the
internet menu, and then A for the Atari menu. From there, it is simply a
matter of hitting 1 through 9 for the Atari BBS's. Atari BBS's in many cases
run on real Atari computers like the one you're calling with.

And the Prison board makes a great E-mail service too. :)

Let me know here if you have any questions, and many thanks to the Prison
Board BBS for this awesome service.

Hello Everybody,
See something interesting:
http://homecomputer.pl/tommark/sprzet/202
Does any one see Atari 520 with strange square keyboard?
Anybody know something and can write about it?
This is my friend's computer and he can't find any information.
Best regards,
Grzegorz

That's not an original Atari keyboard. Well, it is but the buttons are
not. You could buy "key caps" from a company (I forget which) that
replaced the original spongy caps with clicky ones. Some people
prefered clicky keys to the spongy ones.

Joshua.

> So, first conclusion, diskdrive failure. Is it possible to just add an
> "normal" pc style discdrive?

last week I just revived my own ST after years in the attic (very clean
but long storage)
the disk was not good at the beginning , could not read anything
properly, seemed to run slower

then , after a few days , and several tries with non important disks ,
it just recovered then worked fine again ;-)

I also had it extended from 520 to 1040 but it seems that the memory
extension is gone , because it works like a 520 now ...

may have a look inside ...

I liked very much the "spongy" touch of the keyboard, I was already
typing very fast and lightly . It was a bit like what we have know on
lots of PC keyboard or laptops ..

I remember a lot of people disliked it however ...
I hated the big extrmely cliky keyboard we often had on workstation at
the university , but so many people coming to these station were afraid
or reluctant to use these machine , so they needed a strong feeling
upon any pounded key

some even added "bips" or "klungs" to these big KLIKeyboards , to be
really sure they depressed the keys , beeeuuaaark :')

well , sometimes now, I love voice input ;-)

> ST has RGB as it is usual by computers. But I saw some DVD players
> which have RGB outputs too - probably not case in US.
>
yes, in europe, a lot of devices like dvd players or satelite receivers
have RGB outputs through scarts and all TV accept it,just like a ST RGB
output

some devices have RCA plugs in addition for RGB

and some low cost equipment only have RGB output , and when there is
choice through a setting menu , RGB is often the default choice

(the settings menu amaze me because it s not straigthforward to reach
when you are using the remote controler ... and you probably would want
to change that when you can't see a picture ;-) )

On the subject of Compact Flash "hard drives"....
I've heard that there's a limitation to how many times data can be written to these cards. In Atari ST terms that limitation is probably not even worth mentioning, but what worries me more is if sections of the CF card start failing and my data all of a sudden disappears!

Is this something I should be worried about, or are there safeguards against this sort of thing happening built into the CF card itself or HD-driver?

Hallvard

Hi,

I am looking for a couple of Eiffel boards (with or without display) but
with the modern layout with joystick boards.

Unfortunately Lyndon doesn't produce them any longer.

Any others out there who can help?

Thanks in advance,

Frank

I heard that the card itself can detect those "bad sectors" and that
data is written elsewhere safely. Just reducing the size, but not losing
datas. Can anyone confirm?

Else, a flash ram can support about 100.000 clear/write cycles.

Guillaume.

I'm not saying that you are vasting your time, but when the ACSI-IDE
interface will be finally finished (http://stlabs.free.fr/
stdmaplus.html), it will be more flexible:
- ACSI compatible in every way
- Plug and play also
- I don't know much about the speed of it, but I think it is not a
real issue with an ST (they are slow)
- Compatible with every model equipped with the ACSI port
- You can use your favorite HDD driver and other AHDI compatible
softwares
(- not to mention the Ethernet interface)

I hope it will be finished soon.

By the way I found someone here in Hungary, who developed his own rom-
port IDE interface back in the old days (files are dated 1989-1994). I
have the schematics and all the sources of the driver and partitioner
software, if you are interested I can send it to you. I'm planning to
build one, just for curiosity.

> I hope it will be finished soon.

That 'will be finished' is one of reasons why I did it. Several
projects are anounced for years. And nothing available at moment.
ACSI compability means nothing for me. Speed is best of all from ST
interfaces - ACSI port is actually slower than Cartridge Port. Atari
can be pretty fast - almost as new PC in PIO mode (1.7 MB/sec by read
and over 2MB/sec by write ). I Agree that no real need for so big
speeds, but who knows..
Compability with every model equipped with ACSI is not true - there
is a many trouble with diferent ACSI adapters.
HDDriver is not so good as some think - and costs lot of money. For
same money you get IF and SW from me.
And when it works well, you don't need 'AHDI compatible software' -
you need to use it for what is intended - load and save files.

There is no todo item in the hardware section, so I'm hoping the best.
It is hard to see for me, that there are so many parallel developement
for the same problem. IDE interface is one of them. I think we
(actually you, since I can't design hardware) should organize our
resources more. We are not too many compared to the Amiga guys.
> ACSI compability means nothing for me. Speed is best of all from ST
I installed the ATSpeed emulator with Paskud's interface hoping to use
my hard drive. But it was not compatible. You could run MiNT with your
TT if your IDE interface would AHDI/ACSI compatible without further
software devlopment.

I know it. But must have in mind that Paskud was made 15 years ago,
with own drivers. Internet was not accesible in most of Europe. So,
Paskud made driver best as he could.
Today making AHDI compatible driver is not big deal. ACSI is obsolete,
slow...
Even Falcon dropped out support for ACSI in latest TOS for him.

> I don't know much about it. I didn't hear that there are problems with
> the Link97 adapters for example.
I just said that we have some problems. Not all people has Link97.

Every chain is slow as slowest part. Today no problem to make
extremely fast ACSI IF. But you can not go over limits of DMA chip in
ST.

> I didn't speak abut HDDriver but HDD driver.

I really don't know what you mean under 'HDD driver' .

I'm not talking about only Paskud's interface. There is yours, there
is STLabs', there is SatanDISK.
There are the ethernet interfaces (STLabs', NetUSBee). And the most
sad thing is that we haven't got the informations (schematics etc) to
build old hardware though they are not produced/supported. How great
it would be, that someone could build Link97 interfaces, accelerators
like Pak, Cattamaran, VME graphics cards. Are these vaished for ever?

Link97 is just an example: a good ACSI interface can be built that is
comaptible with all models.

I don't know what you mean. My internal IDE IF is 100% AHDI
compatible. And HDD driver compatible,
It is 9 years on WEB, paid by my own money. And there is some
software for it, free.
Now I offer solution for non-electronic people. But main thing is
Flash memory - no need for external power supply like by ACSI.

> There are the ethernet interfaces (STLabs', NetUSBee). And the most

This is what is. And if you think that I plan to make some money
with cartridge IF, you are wrong. I just want to cover my costs and
time for writing software.
Before 1 month I was about to make ACSI IF for CF cards. I made rough
concept of IF (very different than Satandisk and some others, and
would be much faster). But situation here in Hungary with components
is so bad that I need to wait 1-2 months for some components. So, I
went to another solution, what I thinked out last year. It has some
benefits - for instance 16 bit data bus, while ACSI is 8-bit. And that
IF would cost more than Cartridge one - more parts required.

Actually, I'm sure that reason for troubles with ACSI IF is big
difference in SCSI and IDE protocol.
Other reason is that people who develops it is not so good in that.
Big firms lost interest because of small market, and we are now on
amateurs like me.

Beside it, most of projects is not for home-makers. If someone was
unable to make internal IDE IF (what is simplest possible IF at all)
he will not make cartridge or ACSI port IF. Not to mention NETUSBee.

> Any hard disk driver, like Atari's AHDI or HUSHI
>

It is that: you can give here only 3 examples. In reality: AHDI is
slow. HUSHI worked not with IDE interface. So, we are on HDDRIVER
only! And only AHDI is free. It is not good.... over 20 year old
machine so bad supported by hard disk drivers....

Can you tell us more about these troubles? I wonder what kind of
troubles I have missed and have never been reported for the last 15
years or so.
Fact is that ACSI has worked quite well for ST computers for a long
time. One of the reasons is that with Link adapters even modern SCSI
drives can be used.

You should check the facts more carefully: HuSHI supports IDE drives,
and there is at least one other driver, namely CBHD, which is even free.

Hushi worked not for me. However their CD-Tool worked with same IDE
IF.... Funny.
I can not know every driver. There is certainly couple more, unknown
foor masses.

And for troubles about ACSI interfaces - visit some forums.

For SUDOKU fans who have installed a SpareMiNT system on their Atari:
There is another Sudoku game in the sparemint repository. It does not have
a GEM interface, but uses a curses interface and is quite playable in a
Toswin2 window or even without GEM in the easymint login screen.

I just didn't succeed getting the cursor keys to work to move the cursor.
Instead you need to use the h,j,k,l keys. If someone can make the cursor
keys work that would be nice.

I think that such tone leads nowhere.
If I don't know about some driver it is because it is discontinued,
has no WEBsite and similar. I did lot of search with Google and on
forums.
Actually, saying that something works is a confusion in this case.
Why - because you talk in past. Maybe those drivers worked in 1994
wirh some IDE disks of 100-200 MB, but it worked not with 40GB, 4
years old drive...

Simple said, most of drivers is obsolete. And I will not go now on
flee-market to buy some 13 year old 100MB drive to check will HUSHI
recognise it.
So, please talk considering that we are in 2007.

This is why we have HDdriver :-)
Why reinvent the wheel?

I don't understand why you're being so hostile towards Uwe and
HDdriver. After all, how many active supporters are there left in the
Atari community. If you can come up with something better which in
addition is free be my guest.
I'd like to see you put in that amount of time and do it all for free.

Hallvard

You misanderstand what is talken here. I never said that hard disk
driver must be free. No problemos that Uwe sells his program. I just
say that we have not much choice.
Why think that I'm 'hostile'? Actually, I make here 'free'
advertisement for HDDRIVER, by saying that other drivers are obsolete.
Uwe should just little lower his tone, and not talk as he is only who
knows things and everything (see his comments about reading CDs, max
BigDOS partition sizes).

I made at least 5 free programs for Atari ST users in past 10 years.
Some of them are quite complex - as Floppy Imager and Drive Imager.
But most of people just asks more and more. You complain that no PCB
design on sites - then do it, publish it! - Don't take it 'hostile' .
Just open your eyes, see what is done...
So much about free things here from me...

Reply #2:

I clicked on that link: no word about IDE support on that page.
There is 2 dead link and one with directory with about 30 diskutils
for download...

So, I'm guilty because they mention not IDE support?
Should I expect that program old 10 or more years will work well with
new CF cards?
I can do better with my time...

Come on... It is just another example of discontinued software,
discontinued WEBsite.
You need some better example - this just proved what I said.

Hello,

In fact, you both are right, because :
- yes, both CHBD and HuSHI support IDE drives (I used both of them for
some time, but due to their limitation, I had to change for your
HDDriver), but
- they don't work with drives bigger than 8 GB (or so, I don't remember
exactly, but what I'm sure about, is that with both of them, I could
not use my 20 GB HD in totality).
So, nowadays, the only driver that ensures compatibility with all
devices, that is safe and reliable, and that is still supported, is
your own software - do I need to mention you ought to be proud of this ?

Well i know some of you have differing opinions on what the atari community 'needs' but we must remember that without these enthusiastic amateurs/hobbyists there would be no or a very little atari scene. I have been away from the scene for a many number of years and have recently had my interest rekindled by all the new hardware that people are trying to produce. These people are trying to make our machines connectable to technology that wasn't necessary available to the masses back in the 80's and early 90's - USB, Ethernet (internet), Flash Card reader etc.

If someone wants to develop some hardware for us and spend their spare time doing it, we should give them all the encouragement they need and not 'pick holes' in there methods or give them a 'why are you making this bob done that last week'. It's their choice, variety is nice. I have purchased a SatanDisk and will probably purchase the STlabs device when it's available, similar devices, but if i find myself using one more than the other i will put the other on ebay for someone else to use, as most of these creations are only produced for one batch the more in circulation the better.

So to all who keep on developing for the atari please keep it up and you have all our thanks that you still find time to do it aswell :)

## 675. Any chance of a wireless sio2PC

Newsgroup: comp.sys.atari.st
Date: 2007-03-22 03:55:50 UTC
From: user
Message-ID: <2007032214555050073-@news.giganews.com>
Source record: 5889

Do you reckon anyone would ever be able to make a wireless adapter for the 8bit atari to be able to access files wirelessly from the PC?

In the meantime I use an old Fujitsu tablet PC I got cheap to connect up the atari in the loungeroom, but a wireless setup would be great.

> years old drive...

I think you should publish your final hardware and software and then we will see if what you deliver is better than what the other drives I referred to delivered at their time. They were (and still are) used by numerous users and in general all the old drivers are known to work reliably. And they support standardized interfaces like XHDI and/or SCSIDRV, which have gained a lot of importance and are required by various tools and file system drivers.

> So, please talk considering that we are in 2007.

That's a funny remark, considering that by refusing to support standardized interfaces like the SCSI driver or XHDI you are writing software which is not even on the technological level of 2000. Your approach is outdated from todays point of view, and if, as you say, any child can write a driver, I wonder why you have problems with implementing modern specifications.

By the way, about once a year I get an email from somebody telling me he is almost finished with his adapter for connecting IDE or SCSI drives to the Atari. Their approch is always the same: No, XHDI and SCSIDRV are not needed, their own proprietary solution, which is not compatible on the software level to anything is much better. None of these solutions has been finished, and I do not find this surprising.
And this is why rather old solutions like the Link96/97 are still the solutions people are asking about: They exist and they work.

> your own software - do I need to mention you ought to be proud of this ?

The point I am trying to make is that one should not complain about the
software of others by making wrong claims about this software. Even
though some of the drivers mentioned do not support modern hardware they
are modern from a conceptional point of view, supporting layers like
XHDI and SCSIDRV, which are used by various of todays applications.
In order to prove that certain software is outdated one has to provide
better software, not just talk about it.

This discussion just goes in complete unnecessary talks.
I did not started it to get some comments about what we have on market
or what we have in promises, announces.
Did not start to read some preaching about XHDI and SCSI standards.
All it is available on WEB, and is not so hard to implement.

It looks that people has prejudices that so called 'home-programmer'
can not write XHDI or/and whatever other standard driver.
Actually, I made preliminary tests yesterday, and interface + driver
works well with Mint.
So, please stop with negative comments. And BS like: 'we have
HDDRIVER (or ACSI port), why you want to reinvent hot water?'

If you don't have anything constructive then better don't post...

Herr Seimet, you should read my posts little more carefully. I never
said that I will not make it XHDI compatible. You know well that I
said that I will not make HDDRIVER plugin.
And on what base you say that I have problems with implementing
anything?

## 686. M_PLAYER 3.10

> Herr Seimet, you should read my posts little more carefully. I never
> said that I will not make it XHDI compatible. You know well that I
> said that I will not make HDDRIVER plugin.

There is no such thing like a HDDRIVER plugin. SCSIDRV is a modular approach, and if somebody provides such a module drivers like CBHD and HDDRIVER will automatically use it. The Milan PCI SCSI driver is a good example for that. There is nothing that is based on or specific to HDDRIVER.
Re re-inventing the wheel: Those who provide a SCSIDRV plugin do not have to provide anything else: No XHDI, no partitioning software etc. So if you write XHDI code of your own, partitioning code of your own etc. you are going to write much more code than actually needed and the more code you write, the more bugs it will have, the more time it will take you, and the more compatibility problems with other drivers will arise. That's why I said that your approach is outdated, more outdated than the approach used by the old driver you mentioned.

> And on what base you say that I have problems with implementing
> anything?

Well, just do it.

Let's put the driver-specific issues besides for a moment and let's look at an example from the past, which in my opinion is a good example of problems caused by ignoring standards and investing too much time in coding things that had better been spent on other things.
Do you know the TEMPUS editor? It was a well-known editor in the early days of the Atari, and it was blazingly fast. So fast that the author provided settings so that you could slow down the speed with which TEMPUS was scrolling, because TEMPUS was scrolling so fast you could not read any text while scrolling. (Being this fast is useless.)
As long as there were only SM124 monitors (resolution ST high) and old versions of TOS everything was fine with TEMPUS. But this changed with each new Atari models and new version of TOS. With any change TEMPUS was causing more troubles. The author was so keen in writing a software as fast as possible and in going his own way that he disregarded many APIs. Other editors were closer to the APIs and did not have these problems, and these editors are the ones mostly used today. They were slower than TEMPUS when scrolling, but still fast enough.
In the end the users choosing the slightly slower editors were the winners: They can still use their editors today, even though they are not actively maintained anymore. The users of TEMPUS can be considered the losers: Usability and compatibility was sacrificed for a gain of speed useless in practice. I doubt that these users were satisfied with

their choice.

All in all, writing software not based on existing standards, as far as they are available, is usually not a good idea. It is more time-consuming, has a big potential for incompatibilities, and one has to write more code. It has been shown that the number of bugs in a software is roughly proportional to the number of lines of code.

Uwe Seimet wrote:

"....if you write XHDI code of your own, partitioning code of your
own etc.
you are going to write much more code than actually needed and the
more
code you write, the more bugs it will have, the more time it will take
you, and the more compatibility problems with other drivers will
arise.
That's why I said that your approach is outdated, more outdated than
the
approach used by the old driver you mentioned."

As I said IF is intended for ST(e) machines. They are pretty old now.
Even last TOS for them is 16 years old. Forcing modern programming
systems as modular programming, Object oriented programming etc is not
suitable for those slow machines with not much RAM. Most efficient is
still straight programming, in assembler. With lot of branches,
jumps.Must it have many bug? No.
Bug amount depends mostly from careful testing, not how program is
written.
I prefer 'outdated programming' for outdated machines.
There are some other things: driver must be in ROM of cartridge.
Combining it with other software, intended for RAM will just cause lot
of complications, more RAM usage.
And code is 90% finished, why should I now change it?
Partitioning: I asked on some forums about partitioning SW for ST
machines, and result is that we have very little choice.
There is some unfinished open-source project, pretty massive. I don't
think that partitioning must be so complicated. Even Microsoft did it
simpIe. I don't know about what 'SCSIDRV partitioner' you talk.
Why not to make something new?

Uwe Seimet wrote:
" Let's put the driver-specific issues besides for a moment and let's
look
at an example from the past, which in my opinion is a good example of
problems caused by ignoring standards and investing too much time in
coding things that had better been spent on other things.
Do you know the TEMPUS editor? It was a well-known editor in the early
days of the Atari, and it was blazingly fast. So fast that the author
provided settings so that you could slow down the speed with which
TEMPUS was scrolling, because TEMPUS was scrolling so fast you could
not
read any text while scrolling. (Being this fast is useless.)

As long as there were only SM124 monitors (resolution ST high) and old versions of TOS everything was fine with TEMPUS. But this changed with each new Atari models and new version of TOS. With any change TEMPUS was
causing more troubles. The author was so keen in writing a software as fast as possible and in going his own way that he disregarded many APIs.
Other editors were closer to the APIs and did not have these problems, and these editors are the ones mostly used today. They were slower than
TEMPUS when scrolling, but still fast enough.
In the end the users choosing the slightly slower editors were the winners: They can still use their editors today, even though they are not actively maintained anymore. The users of TEMPUS can be considered the losers: Usability and compatibility was sacrificed for a gain of speed useless in practice. I doubt that these users were satisfied with
their choice.

All in all, writing software not based on existing standards, as far as
they are available, is usually not a good idea. It is more time-consuming, has a big potential for incompatibilities, and one has to write more code. It has been shown that the number of bugs in a software is roughly proportional to the number of lines of code."

Your whole example with Tempus has 2 big problems:

1: Atari ST is discontinued machine. No changes will happen in TOS and hardware.
So, no danger that something will become incompatible

2. I do not plan any 'dirty tricks' in driver. All is with regular BIOS and GEMDOS system calls and relative simple MC68000 assembler code.

Smaller problem is constant assuming that program will be buggy.

I have time for such programming. Now have. Maybe after couple months, years it will be not so. So, why not programming? Maybe it is more fun for me than playing Dungeon Master for 199-th time...

One thing more:

"Using SCSIDRV does have its shortcomings. For example, if the SCSIDRV driver does not support a particular device type, you will not be able to use it." - it is quote from Roger Burrows description.

It stays of course for device types - as SCSI, ATA, ATAPI...
However, because IDE port is tricky addressed by writing on cartridge port it is very likely that whole idea about SCSIDRV will simple not work...
Other thing what I don't like is that it is in C. I don't want to mix assembler with C.
Case closed from my side.

Did you mean boards to build, or completed boards?

I had a couple of boards etched ages ago, but I have not tested them yet so I can't be sure the layout is right. It uses SIL resistors that I had to order. I am supposed to be picking theses up on Monday so perhaps by the end of the week I will know if they are OK.

If they are OK I could possibly get you a couple etched, depending on how busy my etcher is. Would bare, undrilled, boards be OK. Or I could send you the layouts and you could etch your own.If you want ready built I may even be able to make those, but my soldering is not great. How keen are you to get them?

However if you can etch your own arn't they layouts on Lyndons site?

> Unfortunately Lyndon doesn't produce them any longer.

Nobody was talking about object oriented programming, and object
oriented programming is no prerequisite for modular programming. There
is no problem in implementing the standards already mentioned using
assembler programming. Any child can do it, even I could :-)

Sure, and that's why one writes a plugin for the specific devices. This plugin consists of the same code you have to write for any new hardware, but since nothing more than the hardware-specific code is needed (i.e. no code for partitioning and other administrative stuff) the SCSIDRV approach is the one with minimal effort.

>
> It stays of course for device types - as SCSI, ATA, ATAPI...

Of course it will work. The same approach works for all current operating systems and for TOS as well.
Can you please elaborate on the part of the SCSIDRV specification you think will cause problems?

> Other thing what I don't like is that it is in C. I don't want to
> mix assembler with C.

Why mix assembler with C? You can easily implement SCSIDRV support in assembler. I also did so.

OK.
Thanx for advices.
This leads nowhere, and we started to repeat things.

For me is simpler to do it on my way. Users will have no benefit from SCSIDRV, except if we count as benefit longer code and less RAM and slower work. Partitioning in CBSD is rather primitive - almost 200KB, for something what can be done in less than 10KB. Just waste of space because of C and unnecessary components as driver install...

I'm done here...

Hi,
This site has a converter. That will allow extractions, but a lot of MSA
DISKS have encryption (i.e) ICE, and will not run with out being decrypted.
Anyway the site is :
http://msaconverter.free.fr/index-uk.html

I would like to find a Windows based program that will decrypt ICE
encryption..

The thing I find funny, is Jay Miner, the guy who invented the AMIGA, is the same Jay Miner that invented the Atari 400/800 line.

Jack Tramiel and his people who was responsible for the C-64 are the same ones who created the Atari ST. If you were a *real* fan of the earlier machine, you should have switched companies, and stayed with the people who designed your beloved machine. What would have been funny, is if Commodore did not sneak in at the 11th hour, and steal Amiga from under Atari's nose, and it would have been the Atari Amiga and the Commodore ST.

SCSIDRV plugins are only a small subset of a complete driver, so they
are natrually much smaller. It's a pity that you do not even try to
understand the concept.

Yet another 'misinformation' :

I checked CBHD, ver. 5.02 with 40GB Maxtor, 128MB Transcend IDE-Flash
and one CF card.
It recognised none of them. (While all work fine with some other
drivers - Not 100% with HDDRIVER, which sees one of the partitions,
but opens not files (no, it is not FAT32, just simple BGM
partition) ).

And this is really my last word here:
This thread was just a huge waste of time. I did not get anything
really helpful.
Just a theory. Facts show different things. Amen.

There must be something wrong with your partitioning software :-)

> Just a theory. Facts show different things. Amen.

For 20 years nobody has noticed that the current driver concepts only
work in theory, not in practice. It's amazing how many users are having
hallucinations. Thank you for trying to cure us :).

Hello,

IIRC, CBHD doesn't install any driver on to the disc. You have to
manually copy (I don't remember what) on the partition before you
can boot from it.
For PC partitioned discs, it's another thing. I remember I had
problems with earlier versions of HDDriver, but Uwe must have
fixed this now, as all works fine for me at least since 8.17 ;-)

A Commodore ST would probably have used a 16-bit 6502 variant and probably would have
helped MOS Tech stay relevant much longer than it did. If Commodore had been capable of
keeping it's talent around a Commodore ST would have been an absolutely awesome machine.
But, Jack and Irving had a knack of running everyone off until online Irving was left.

## 713. PS3 Around the World

Newsgroup: comp.sys.atari.st
Date: 2007-03-25 07:25:25 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <460623e5$0$5096$ba4acef3@news.orange.fr>
Source record: 5827

Hi All,

I got my brand new PlayStation 3 yesterday. I use it for the moment as a media centre, because it requires a HD display to install Linux (YDL 5.0 <http://www.terrasoftsolutions.com/>) and that my 20" 16/10 DELL screen has no HDCP decoding chip to handle High Definition. I'll probably have to get a VGA-Box to connect it, but all this is so fresh !

Looking at this for Linux :

<http://www.terrasoftsolutions.com/support/installation/ydl5.0_ps3_guide.pdf>

I was wondering about great opportunity to port ARAnyM's VM on PS3.

Somebody of us is interested in that challenge ? That really looks promising to me ... My own conviction !

Feel free to comment :) The French community is not enthusiastic :(

Best regards,

# 714. Help with HDDRIVER & 100mb ZIP drive

Newsgroup: comp.sys.atari.st
Date: 2007-03-25 10:48:48 UTC
From: blah@blah.com
Message-ID: <khkc03560f4qd507g8c1tuier3hfsgiinh@4ax.com>
Source record: 5828

Hi,

Can anyone tell me how I can get a Iomega SCSI 100mb ZIP drive working
with my Falcon & HdDriver v8.18? The Falcon is not running any
replacent OS or desktops.

The falcon has four partitions on the HD C, D, E & F. I've run
HDDRUTIL.APP
from the C drive and 'Intstall HDDRIVER' to the root of the E drive.
HDDRIVER.PRG is
in the AUTO folder on E and I've then rebooted to E.

How do I add an icon/shorcut to this device onto the Desktop?

From within HDDRUTIL I get the following:

HDDRUTIL 8.18 Device Check

Operating System: TOS 4.01

Bus 2: Atari IDE
00.00: TOSHIBA MK1724FCV R0.1 Direct Access
Bus 1: SCSI
06.00: IOMEGA ZIP 100 E.08 Direct Access
07.00: ATARI FALCON HDDRIVER 0818 Processor

The ZIP/JAZ drive menu just shows 'Atari IDE 00.00: Toshiba MK1724FCV.

Appreciate I'm probably missing the obvious here :-)

Once HDDRIVER has recongnised the ZIP drive do I just add an icon onto
the Falcon's desktop.

Thanks in advance

Dave

Well, I think we were more objecting on the price/power ratio of this machine; specially when the idea is to run a virtual machine.

If an Atari emulator was spending it's time doing floating point operations, no doubt that the PS3 would be quite an efficient machine for that. But for running an emulation core, I fear that it will be less efficient than any standard desktop pc processor.

Will see :)

I promised a bottle of champagne to Fran�ois if he managed to run Aranym on a PS3 showing benchmarks which indicate numbers superiors of what we would got on a similarly priced PC at the time of demonstration (similarly priced meaning "only the desktop unit, without counting the price of screen, keyboard, mouse, loudspeakers, etc... because they are not comming with the PS3 either).

So well, this can be interesting to see :)

There are some translated CBHD files in the Misc section of my we site,
if anyone is interested. I don't know if they give a blow-by-blow
account of installing it though!

FWIW, the file DRIVER.SYS or similar name is written to the C: drive,
and the necessary code to run that driver is written to the drive's
boot sector.

Yes, just like you would with any other drive. In order for HDDRIVER
(and not just HDDRUTIL) to find the drive ensure that HDDRIVER is
configured to check the ZIP's SCSI ID. The manual provides details on
how to configure which drive IDs should be checked.

## 723. hp business inkjet 1200d - will it work on an Atari ?

Newsgroup: comp.sys.atari.st
Date: 2007-03-25 18:06:22 UTC
From: paul williamson <paul.williamson@zetnet.co.uk>
Message-ID: <4606ba1e$0$762$4c56ba96@master.news.zetnet.net>
Source record: 5837

Hi all,

Does anyone know if an hp business inkjet 1200d printer will work on an Atari ? I need to replace the printer on my Hades, which I use in single TOS to print from Cubase Score, and also in MintNet to print from Papyrus.

The hp business inkjet 1200d has a parallel port as well as USB, but I don't know if the NVDI HP Deskjet 1200 colour driver will work with it (I use NVDI 5.01).

Alternatively - any other ideas for a good replacement printer with a parallel port - preferably one with a USB port as well ?

Thanks in advance

Paul

The Automation disks are in .ST format. Best I can do with the utility
you linked to is to delete files from the image. That leaves their
entries in the menu screen.

Better than nothing, but there must be a utility out there, somewhere?

The old 1200 we have at office is only capable of 300 dpi, and the data
I found about the 1200d say it can 4800 dpi.
So, even if you can use it with the old 1200 drivers, I think you won't
be able to benefit its possibilities.

PW>an Atari ? I need to replace the printer on my Hades, which I use in
PW>single TOS to print from Cubase Score, and also in MintNet to print
PW>from Papyrus.
I'm not really sure, but I suppose very strongly that the mentioned
printer will *not* work with any - not emulated - Atari.

For last year I had to make some bad experience with a recent HP laser
printer:

Trying to put out one single character (even ESC...) stopped my TT's
TOS at once. Ok, inkjet is unequal to laser, but HP printers used to
be compatible to one another.

Sorry! But please do tell me if I'm wrong!

Right, I've enabled 1.7 in the 'Devices & Partitions' box, the device check confirms that the ZIP is on bus 1 07.00 (is that the LUN?).

Now if I go into the ZIP/JAZ drives menu all I can see si the Toshiba IDE hard drive as before. Adding further desktop icons still does not allow access to the ZIP.

Just be be sure I'm doign everyhting there are a few points in the printed manual I could do with clarification on...

1.1.1 - There should be no HDDRIVER.PRG in the auto folder?

1.2 - This states that the program is installed to the root (boot) drive as hddriver.sys but then says if run from a floppy it needs to be .prg. Are .sys and .prg mutually exclusive?

Right, just had another scan through the manual and I think I've done everything correctly but nothing but nothing will allow this ZIP to be picked up.

Thanks,
Dave

I love the newsgroups,

Images, video, mp3 music, the real news from around the world... it's all inside waiting for you.
With some of the fastest connections around it's no wonder people love it and keep coming back.
Great prices and support await you as you travel into the beautiful world of premium nntp access.
You can find almost anything you are looking for.
They give you access to some of the best groups others may not carry.
They offer some of the best premium newsgroup access anywhere.
One thing I love about them, they don't keep log files of the news I read or files I download.
Take a look, I know you'll love it as much as I do.
Take a look at all the great features below and imagine! You'll LOVE it.

Blazing fast downloads
800 GIGS of new multimedia content each day
2,000,000 new posts each day
Very long retention
Keyword searchable
Posting allowed!
Convenient thumbnail indexes

Check out http://www.newsdude.net and you will love them too.

I have SCSI ZIP100 drive on a TT

blah@blah.com wrote:
> Right, I've enabled 1.7 in the 'Devices & Partitions' box, the device
> check confirms that the ZIP is on bus 1 07.00 (is that the LUN?).

In your previous post it was bus 1 unit 6 :-)

Use HDRUTIL and perform a autoconfigure (rightmost menu title)

reset

Which OS do you use?
if TOS, do Options->install devices

One of the icons should be your ZIP, probably the highest letter.

If you dont use TOS, I dont know, unless you use Mint/XaAES/Teradesk.

Factory formatted ZIP disc are not recognized by single TOS.
For those you must use MiNT.

However, you can repartition ZIP media for use with
single TOS. HDRUTIL is your friend.

^^^^^^^^^
That should have been 'partitioned', sorry.

Never format a direct access medium, unless it is so full of
read/write errors that it would be useless anyway.

## 737. Eiffel boards made in the UK

Newsgroup: comp.sys.atari.st

From: David Wade <g8mqw@yahoo.com>
Message-ID: <ePGdnc5FaI1_0ZXbnZ2dnUVZ8tijnZ2d@eclipse.net.uk>
Source record: 5750

Folks,

I am considering getting some Eiffel boards etched and drilled. At present I don't have enough interest to justify commercial production, but if there was enough interest I could be tempted. So assuming I could get bare PCBs drilled and etched would anyone be interested in:-

1. Etched and Drilled boards, original design no temp sensor => you to supply all parts and build.
2. Boards with a pre-programmed PIC chips => you supply other components
3. Complete kits of parts.=> You build
4. Built and Test boards => you need to connect in to PC.

I hope to have some costs soon and I will update when available. Please e-mail the adress in the header with any expression of interest,

Dave

OK, I have Old World ROM machines. Currently setup is my Mac 9600-200
in which I installed MagiCMac for OS9 under. So if i run MagiCMac for
OS9 on my 9600 I already have everything I need? If so how do I
configure it, IConnect, or whatever is required to get it to work?

I do remember years ago on the MagiC Support Site http://magic-sides.de
that people had access to the Mac OS9 TCP on 2nd and 3rd generation
iMacs so there was some software or feature to allow them on New World
Machines to use the Mac OS TCP.

As Henk already pointed out, your device is 6.0, as displayed by the ID check, not 1.7.

> 1.1.1 - There should be no HDDRIVER.PRG in the auto folder?

Right.

> 1.2 - This states that the program is installed to the root (boot)
> drive as hddriver.sys but then says if run from a floppy it needs to
> be .prg. Are .sys and .prg mutually exclusive?

.sys is used when booting from hard disk, .prg when booting from floppy (AUTO folder).

Ok, success! It all works now and I can see the ZIP drive in all it's
glory. Thanks for your advice!

>If you dont use TOS, I dont know, unless you use Mint/XaAES/Teradesk.

Well funny you should mention that. Now I have a backup of the C:\
drive I'm going to install one of the MiNT distributions along with
the free AES. What are people suggestions?

Also does anyone know where I can find an English install doc for the
EasyMiNT or one of the simpler distributions?

Thanks
Dave

# 744. Eizo Flexscan 6550 - Free to good home

Newsgroup: comp.sys.atari.st
Date: 2007-03-27 20:24:14 UTC
From: blah@blah.com
Message-ID: <1qui039filuiv93oe03a87reii3laqopsj@4ax.com>
Source record: 5758

Hi,

I have an Eizo flexscan 6550 monitor that has been bubble wrapped up
in my garage for ages. I bought this with a TT a year or so ago and
dont have the room for it.

Last time it was connected to the TT it worked fine and the quality
was great. This thing must have cost a few thousand when new.

I'm located in Bedfordshire in the United Kingdom and so anyone wants
it and who can pick it up is welcome to it.

As the subject line say this monitor is free to a good home!!!

Please don't ask if I can ship this because...

a) it weighs a ton and would cost a fortune
b) it would be a bit of a chore for me finding boxes and packing it
up.

I will re-test this prior to collection.

Dave

It says it supports:-

"HP High Performance Architecture PCL3"

If this is the same as PCL3 then it should work fine....

> I'm not really sure, but I suppose very strongly that the mentioned

Thanks for the information. I will be quite pleased if I can print
300 x 300. I suspect that is what I get at the moment using my
HP Deskjet 600. My printer is also connected to a Linux PC, so I can use
the higher resolutions from that for photo printing etc. It is mostly my
music printing from Cubase that I really have to use the Atari for, and
that looks fine in 300 x 300.

Cheers

Paul

> OK, I have Old World ROM machines.

Fine! I've a PB540c (Mac OS 7.6) and a Quadra840av (Mac OS 8.1)
running under MM - mostly rockstable...

> Currently setup is my Mac 9600-200 in which I installed MagiCMac for
> OS9 under

Mac OS 9? Why? I've a PowerMac G3-MT@399MHz (overclocked) too and it
still works fine under Mac OS 8.6...

> So if i run MagiCMac for OS9 on my 9600 I already have everything I
> need?

Yoh! But for your machine IMHO Mac OS 7.6.1 would be enough (small and
beautiful) if you don't have HDs bigger than 4 GB and Mac OS 8.6 (not
so small but much more beautiful) has simply all you need - Mac OS 9
is just overkill! BTW: You properly would need FPUPATCH.TOS...

> If so how do I configure it

First of all: Configure your Mac TCP/IP connections - you need a
working Mac TCP/IP network! Than copy from the Mac OS folder inside
MacTCP-Connect-Disk MacSTip somewhere you can find it; now change into
MM and run SETUP.PRG from the MAGIC folder - therefore you need BTW a
serial, but you can simply use your CrAB 2.8 serial!

SETUP.PRG will install a very old PPP-Connect, so be careful and make
before running it a buckup of your PPP folder and from SOCKETS.PRG
inside your AUTO folder! After running SETUP.PRG restore your PPP
folder by overwriting it with your backup and SOCKETS.PRG - now
you should've STIP.PRG inside your PPP folder and AUTOSTIP.PRG
inside AUTO folder and a new CAB.OVL - that's all you need!

> IConnect, or whatever is required to get it to work?

Yoh! With ICONF.PRG you configure now ICONNECT to work /via Mac-OS/
and that's normally all - but you also can tune it a littel bit using
the Pro mode: Increase eg the DNS-Cache at 256 KByte and adjust the
MTU at 1492 and TTL at ~ 117... and don't forget to store it!

After that change to Mac OS and start MacSTip manually - it will open
the Mac TCP/IP network for ICONNECT! Now change to MM run ICONNECT and
enjoy speed with CrAB or HIGHWIRE (with iconnect.ovl as network.ovl)...

> I do remember years ago on the MagiC Support Site http://magic-sides.de
> that people had access to the Mac OS9 TCP on 2nd and 3rd generation
> iMacs so there was some software or feature to allow them on New World
> Machines to use the Mac OS TCP.

I never used Mac OS 9 - I change after G3-MT to Win32 and use w2k now;
therefore I've M_PC too but normally don't used it... my 68k-Macs
under MM are fast enough for me!

That is not hopeful news. I'm told that the 1200d uses PCL3
(Printer Command Language level 3). Do you know if your laser uses that
or some other language ?

Cheers

Paul

Good to hear that everything works now as it should!
Just in case you are not aware of it: You can use the ZIPCTRL tool on
the HDDRIVER driver disk to control certain features of your ZIP, in
particular password protection and motor sleep time.

Hello,

I have been using a LaserJet 4+ with both my FalCT60 and TT, and now
I'm using a Lexmark Optra S1250.
I can print from Calamus, QED, straight from desktop, and never had
my machines stopped.
I hooked an Epson Stylus 800 too, to print a 80x80 cm page (tiled,
of course!) using DA's Layout and Calamus. It gave me far better
colours than a DeskJet 560 and Canon I-don't-remember-what...
Also, my old Canon BJ-130e did work fine - better than the BJ-10e ;-)
BJ-130e, Stylus 800, DA's Layout : that was under TOS, long ago,
now I use MagiC! and all works (nearly) fine ;-)

Regards,

J.-Luc

# 761. Re: hp business inkjet 1200d - will it work on an Atari ?

Newsgroup: comp.sys.atari.st
Date: 2007-03-29 19:39:00 UTC
From: Peter_Schneider@b.maus.de
Message-ID: <200703292039.a54226@b.maus.de>
Source record: 5776

Hi Paul,

PW>That is not hopeful news. I'm told that the 1200d uses PCL3 (Printer
PW>Command Language level 3). Do you know if your laser uses that or some
PW>other language ?
I tried to help a friend and was disappointed that I was not able to
output a single character for I'd hoped I could maybe use ESC
sequences for or to put the driver into a different PCL or make it
compatible to a printer suitable to an Atari's parallel port.

My TOS (I think it's 3.06 or so) stopped immediately. Having hooked
both printers (the 13xx laser and my 5L) to a switchbox, I was able to
"reanimate" my TT by turning over to the 5L.

The only chance I saw for my friend was to print into a file, bring
this file to his PC (by floppy or CD, problem: he had no burner with
his ST, and maybe no floppy drive with his PC, sorry but I don't like
Mr Gates) and then print from DOS or Windows to the LPT1: port.

But how to explain this to a real "user" (no expert)?

As my 5L prints fine, I don't know when to face the same problem as
yours.

But I appreciate any hint to a laser or deskjet printer (probably not
HP) that is capable to print from an Atari's parallel port as we have
been doing for so many years...

Last remark for now: I asked in thae German Atari forum, if it's maybe
possible to configure that HP printer on a PC, save the configuration,
and use it further on the Atari. But Michael Ruge, one of the experts
answered: No chance.

Paul, I'm so sorry for the bad news, and still I hope to be proved
wrong, but perhaps I can save you some money (if you don't buy a HP).

I'm pleased to report that Roger Burrows has wrapped this code up in a
nice patcher program. It's for MagiC versions 5.xx and 6.xx, is
reversable, and is available for download from the MISC section of my
web site, URL in sig.

# 766. CAFCRACK v1 New Crack For Cubase Audio Falcon 2.06

Newsgroup: comp.sys.atari.st
Date: 2007-03-31 22:00:48 UTC
From: Jean Pat <jeanpatataribatvoila.fr>
Message-ID: <460eda31$0$27289$426a34cc@news.free.fr>
Source record: 5779

April Fools' Day 2007,

More than ten years after Steinberg's withdrawal from the Atari Market,
here is a new crack called CAFCRACK for Cubase Audio Falcon 2.06.
Of course with this crack, you needn't the 128 bits key dongle plugged
on your Falcon. (OKI japan M7H007-024 SYNS0 E 3432351)
This crack is better than other existing Cubase Audio cracks on Atari.
This cute hack is the result of months of tough research.

Attention was turned to Cubase stability and data integrity which were
the lack of the other previous cracks.

You must understand that it's impossible to know if this crack is perfect.
If you encounter any bugs you can report them on Atari newsgroups or forums.

There are only 2 drawbacks (I think they are minor):
- Cubase takes up more memory (+25%).
- Each part or track data needs twice more memory size ( 192 bytes instead
of 96 ) but no influence on MIDI events.

But one thing is sure: this is the BEST crack ever made for Cubase Audio
Falcon!

You must put in the same folder CAFCRACK.PRG and CAF_206.PRG of your current
Cubase folder. CAF_206.PRG needs to be unpacked. If you are using the cubase
score editor, you must put a specific patched SCORES35.MOD file in the
MODULES
folder. Be sure that the files attributes are not in read-only mode.
Data is written in SCORES35.MOD for each cubase launch with CAFCRACK.

You will find in CAFCRACK.ZIP:
- Unpacked CAF_206.PRG
- Patched SCORES35.MOD
- CAFCRACK.PRG
- CAFCRACK.TXT

http://jeanpatatari.site.voila.fr/cafcrack/v1/CAFCRACK.ZIP

I've just finished my latest project, Windows Vista for ATARI ST.

Now you can play all the latest PC games on your ST - without any additional hardware. Because of my superb program code, all Windows Vista compatible programs will work in all the ST's resolutions.

Windows Vista ST will be available on disk, CD or punchcards.

Here's the website :

I received a Falcon and almost everything seems in order except Im missing a few pieces. I was wondering if anybody happen to have a spare floppy disk mount (mine is just sitting in the case loose), and a "." key (the one on the numeric keypad between the "0" and "ENTER" key)? I can pay somebody for these, just let me know.

Thanks,
Chris Ryan

Yes, Vista is absolutely terrible. I sorted out the next door's wireless a few weeks back and they have a new Vista laptop. Always I reboot the machines a few times to make sure they retain the WPA/WEP stuff in their profile.

Talk about slooooooowww. It's like 5-minutes odd to boot up on a brand new laptop with so much anti-virus shit and gizmo crap on it. My IBM 486 laptop running 95 is faster than theirs. And mine is 15-years old!!

Glad I was there in the 80's.... No really, I am so glad.

This machine I'm typing this on is an AMD Athlon 2600+ running 98SE, 512MBytes of RAM, a 3COM 54b adapter. It boots in 10-seconds flat.

# 782. The 50 TT030 Users for the CT60...

Newsgroup: comp.sys.atari.st
Date: 2007-04-02 18:56:31 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <001df4e5@familynet-international.org>
Source record: 5796

FamilyNet International Newsgate

I asked for 50 users, we now have 56. ;)

This will be my last message on this for quite some time. However, a while back there was said there would be no CT60 for the TT030. The developer stated (looking back) that there was no interest in the TT030, getting only 30 people to sign up. We now have nearly 60. And that is just for individual users. I'm sure once this is a viable product that more would definately want this product.

While 60 users might still not be the size of a the Falcon base of users, there is definately a lot more than 30 out there.

Final message to Rodolphe, the developer of the CT60, is that there is potential business to be had in the TT030 market. If you can find a way to adapt the CT60/CT63 for the TT030, you have potentially sixty known users that will buy the new developments as well.

On a personal note, in your face Rodolphe and your rude attitude a year ago about there only being 30 TT users that cared. That statement no longer holds water.

Be well all,

Doc Clu

My Mac boots in 0.000 seconds. Well of course it doesn't, but the fact is - that it seldom gets rebooted. It stays on 24/7, eats only 20W of power when idle (30W at full tilt), and never crashes.

My other half's is a PII-400 dell laptop running XP SP1 (before the nightmare of SP2), and that's also plenty quick enough for daily email/ internet/word/excel for the wife.

Vista - Just Say No.

Well the only way to find out is to try it. I personally wouldn't
though, unless I had a backup, and a desire to format my hard disk
afterwards.

I'm sure someone else will enlighten us soon enough ;-)

BTW, what was wrong with the old crack? I used it for a long time with
my CAF because I wanted to use the cartridge port for something else,
and I don't recall having any problems.

May not have that choice..

I must make a point of buying OEM XP-Pro before they completely discontinue
it.

Oh SP2 ..don't even go there. I don't update! Mind you, I don't enter any
personal information into a computer either. Do you think I'm mad? :-D

We grew up with these things... And now they expect us to enter all sorts
of information into. "It's perfectly safe."

Dammit. I have the German one (286) whose name I forget. Still trying to find software/drivers for it. Running a 386 will be tricky, 286 was 16 bit and 386 was 32 bit. Isn't it funny, taken till last year to get to mainstream 64 bit;-)

Few years ago, I started to work with a cracked CAF version.
I noticed cut,copy,paste and move bugs ( infinite loop ) when I selected
several parts at the same time.
Some of my big songs after a loading lost few events or simply crashed.
I thought about Cubase bug, but it came from the crack.
Now I have an official version with a dongle, and it's perfect!

But I will try this new version.

## 789. The 256 Users for the WeST...

Newsgroup: comp.sys.atari.st
Date: 2007-04-03 11:59:13 UTC
From: ggnkua@gmail.com
Message-ID: <1175601553.086526.128030@n59g2000hsh.googlegroups.com>
Source record: 5703

(this was posted originally here:
http://www.dbug-automation.co.uk/forum/cgi-bin/yabb2/YaBB.pl?board=hardware,
posts will be gathered there)

Ok, I'm ripping this idea off another forum, but hey!

Here are the facts:

a) We like Alison :)
b) We think she's a great HW developer
c) We dealed with her and we can say that she's an absolutely
fantastic, good mannered, proffesional, etc. lady and we'll gladly
deal with her anytime :)
d) We want a neat CF to ACSI solution!
e) We want to motivate her to finish WeST

So we're trying to gather as much interest as possible, so she can be
motivated to finish it :)

You ask "What's a WeST?". In her own words:

"Ah, WeST. I want one. I just can't get the motivation. This Scart/VGA
thing will spark it off if there's interest in it like there was when
PeST was launched.

Over the last few days with moving this and that, a WeST would be so
handy. It's almost finished. It communicates on both sides, that's the
hardest bit and tested, it's just getting it to say the right things
which needs to be finished. I kind of have a reputation for doing
that, ...enthusiastically starting a project and doing the difficult
impossible bits, then losing interest.

WeST, if ever I finish it, is imagined to be about 2inches square!!
And that's it! SD card socket on the back. 2.1mm power connecter. I
was even having silly ideas of putting a rechargable battery on it so
it could run standalone. It draws about 150mA, mainly due to the high
MIPS of the MCU. And given that most 4.5v board batteries are
something like 400mA I'm wondering if the size could be justified. The
whole board would be encased in heatshrink like PeST, and a battery
would really mess that up. Could just have a 9v radio battery hanging
out if someone wants portable.

I want it to be about 2inches square. And I haven't even had a
professional prototype PCB made yet, which would be much larger. Once
it's all finalised, it then goes SMD."

and

"I was developing WeST which is a CF card ACSI hard disk interface, just that the newcomers expect to pay like a tenner for it and then start complaining about how much it costs. Fine. Solution is simple. I'll (we'll) do something else. I was getting transfer rates well up to the DMA maximum of 1MB/second. As purely I was proud of what I was doing so put the time into the it's development. It's took months of 8-hour days to develop something that not only worked but had full CRC capability too. Microcontrollers with lots of I/O and which run at 40MIPS ain't cheap!! About £15-20 a go if you're splitting hairs. Now if I was buying them by the thousand then maybe lets say £8-9. The reason why your USB card reader for your PC only cost a tenner is that they made 5-million of the things in China!!!!!!!"

So, if you're serious about getting one, please reply to this post, stating how many interfaces would you be interested to get. I can't get a price quotation at the moment. Maybe in due time. All will depend on demand I guess!

So, get replying ;)

(P.S. the 256 is just a fictional number I made up! Besides, $100 is a round rumber, right? :P )

Thats the one. You bloody little ripper;-) Been hanging out for ages to give it a whirl, but never able to find drivers. I actually bought my Falcon number 2 in to work today to format some floppies (Windows still sucks at it) which I use for bios upgrades. Will fit the Falcon speed to it tomorrow. Lucky I put a 20 gig drive in it;-) Probably have to do the Dallas chip too. Haven't fired it up for a while.

Anyway, I owe you one;-)

Viva la Atari

Hi everyone, I was wondering if someone has Last Ninja 3 for sale, complete in the box for Atari ST? I have Last Ninja Remix and Last Ninja 2 and I am trying to complete the set. I will offer 8 british pounds or $15 for the game complete. (I will also pay for shipping from wherever) Thanks. -STcomp ps preferrably the original large box version, but I will also consider the budget re-release

# 794. My Hades' dead :-(

Newsgroup: comp.sys.atari.st
Date: 2007-04-04 13:41:54 UTC
From: Axel <aspam@geekdot.com>
Message-ID: <1175694114.333310.65670@y66g2000hsf.googlegroups.com>
Source record: 5708

Hey Gang,

After years of Atari abstinence I though it might by cool reentering
the matter by "real mens hardware". So I got myself a nice Hades060...
that's the good part.

The bad part is: No picture :-( (Tried a CRT and a TFT)

Here's the config (as far I can see):
It came with a PCI ET4000W32 card but I also tried a ET6000 I had
lying around and even an ISA ET4000. There are 2 32MB SIMMs in the 1st
RAM bank. All CPLD/FPGAs have heat sinks on them, so I can't tell any
revision of those.
The board looks very original aka un-modded, eg. there's a 15MHz osc.
fitted etc.
Just to be sure, I connected a Keyboard and an original ATARI mouse.
The power supply is checked OK.
Using a POST-card I checked the PCI voltages - they're all there. Also
the bus clock is available.
An IDE harddrive's fitted but it does not matter if it's connected at
power-on or not - same behaviour. No Floppy connected.

Any hints you could provide to help me reviving this beast? Is there
any way to tell it's health by not having a screen output? I wish
Fredi had spent the extra 6 cents for an LED or two :-/

Thanks for your help in advance!

Cheers, Axel

Hello all,

Well, I did it... I unpacked the whole archive onto my FalCT60, on an
unused partition, and copied some files from my working 2.04 version,
the most important being MROS_345.
Then I launched it under MagiC! first - it would have been nice if it
could have been patched so as to be MiNT and MagiC! friendly! - but,
unfortunately, it just caused the computer to reboot :-(
I then switched to plain TOS, 1024x768x256, connected my SC-55 to the
FalCT60, ran cafcrack, and got the display.
Loaded some MID files, they played fine. Even some that made v2.04
crash when remix with optimize display.
I had very few crashes for all the time I tested it (about 4 hours),
only 2 or 3, nothing that couldn't have happened with my 2.04.
I didn't try audio section, since my FalCT60 has no SCSI HD, but so
far as MIDI is concerned, all seems to work fine.
If someone can try the audio section and tell us what's up...

Regards,

J.-Luc

I have tried audio and midi with the complete Cubase package provided with
the crack on my basic Falcon 030. I didn't find any bug, no crash when move
or copy parts ! All seems to work perfect !

Do you remember when your 2 or 3 crashs occur ?
Maybe it's your custom package or the CT60 ?
Did you think to replace the SCORES35.MOD file ?

I also remember that loading songs made with a cracked version on a legal
version could result in a crash.
So I think that the old cracked version saved uncorrect informations in the
song file.

Is this much different from SatanDisk?

am i right in saying this is the same but plugs into the cartridge port?

I'm not saying this to start a 'this is better' thread just for a general comparison.

Saying that i would still be interested for around the 50GBP mark - can't have too many gadgets!! :)

Did anyone try to measure the time it takes to boot a simple ST or Falcon
with plain TOS and not too many (or no) AUTO folder programs and desktop
accessories ? I really love(d) that TOS-in-ROM concept !

But things like FreeMiNT and NVDI slow down the boot process.

Yes : when I clicked too fast on "Close" after I loaded a midifile, when
I try to load my CueTrax, Studio and StyleTrax modules, or when I tried
and copied the Studio module I found on Atari Music french site.

> Maybe it's your custom package or the CT60 ?

I click onto "Ignore" when it asks about caches, at start, because
clicking either "5 sec." or "No" might result in hang when displaying
the start window.

> Did you think to replace the SCORES35.MOD file ?

I left the one found in the archive.

A> Just to be sure, I connected a Keyboard and an original ATARI mouse.
[...]
A> An IDE harddrive's fitted but it does not matter if it's connected at
A> power-on or not - same behaviour. No Floppy connected.

Well, for Ataris it's usually helpful to have a floppy inserted - its presence/boot sector is checked when booting and at least without floppy in the drive the Atari will take very long to boot. Never tried without floppy drive...

Is there a keyboard-click? If yes, then at least some minimal initialisation has been successful.

Where do you live? Maybe there is someone close to you with another Hades to do some "exchange the parts" tests...

Regards,

Alexander

I got the printer yesterday, and once I figured out that it didn't like the printer sharing device that I had been using to have two computers connected via the parallel port, it worked straightaway with my Hades.

I can print from Papyrus fine (using MintNet/N_AES) without any need to change any printer drivers etc, and I can also print from Cubase running in single TOS.

The quality is excellent, and the printer is much faster than the HP deskjet 600 which is replaces.

I have been able to connect the other computer via the USB port which this printer also has.

It was not a cheap option as printers go these days, (130 UK pounds) but it is designed to be used by a small business, so I hope it will give several years of service.

Thanks to all for the helpful suggestions while I was choosing which printer to get.

Cheers

Paul (W)

Hi Paul,

I'm sorry I didn't get into the thread (my CT60 is down, and I don't log on to CSAST as often as I used to). Anyhow, PCL3 was the primary printer language HP used in the 300 dpi days, and selecting a HP 500 or 600 series driver will generally give you PCL3. Laser printers extended the command set through PCL4 and PCL5 before the invention of PCL6, which has nothing whatever to do with PCL1 - 5.

I am glad to glad to hear that a PCL3e printer understands the stock PCL3 generated by the Hades. This makes logical sense, but what is sensible is not always what is true.

Galen

First of all: Thanks for helping, Alexander! (Daaaaankeeeeschööööön!)

Ok, so I've connected a floppy and it did some sort of minimal
seeking. So it might check for something bootable (which I don't
have).
Just for the fun of it, I've inserted a random DOS floppy, just so the
Hades has something to chew on. No change...

To be really, really sure, I've ripped the poor Hades out of its case
and let it run "naked" to prevent any shortings.
This brought me a bit further in the way that the connected monitor
now syncs (i.e. detects a signal) to 76Hz, but still no picture. Just
black.

> Is there a keyboard-click? If yes, then at least some minimal initialisation has been
successful.

Good idea... need to find a "victim-pc" to rip out his speaker... give
me some time after eastern.
What I can tell is that the keyboard LEDs do work (Caps, Numlock) but
I guess that's handled by the keyboard controller, so no real sign of
life.

> Where do you live? Maybe there is someone close to you with another Hades
> to do some "exchange the parts" tests...

Hamburg, Germany. Any takers?

Cheers & happy Eastern, Axel

The Hades should give you at least the black and white Medusa logo at
boottime. That doesn't depend on the graphic card as far as I know.
Can't tell you now as my Hades is dead too. :-(

Long time ago when I recieved my Hades I had exactly the same. No display
at all. It ended up in a new motherboard. At that time there were new
boards available but now ...

When I restarted the DarkForce! BBS, it was for the
same reason that I first started it up in the early 90's.
Namely, to contribute to, participate in, and give back
to, the Atari community, all that I've gotten from it.

With that in mind, here is what DarkForce! did in the
year 2006:

January 2006
1. $25.00 - Slor
2. ST Mag - Doc Rotcod

February 2006
1. $25.00 - Morden
2. ST Mag - Showa

March 2006
1. $25.00 - Mark Chitti
2. ST Mag - Arch Mage
3. DGS 8Bit CDROM - Stephen

April 2006
1. $25.00 - Slor
2. ST Mag - Sthelir

May 2006
1. $25.00 - None (rolled over to next month)
2. ST Mag - J_D
3. PEST - Zeptari
4. USBcart - almostrice

June 2006
1. $50.00 - None (rolled over to next month)
2. ST Mag - DocClu

July 2006
1. $75.00 - AlmostRice
2. ST Mag - Pantera

August 2006
1. ST Mag - Gemini8

September 2006
1. ST Mag - Wulfie

October 2006
1. ST Mag - Dew_it

November 2006
1. ST Mag - Sauron

December 2006
1. ST Mag - Callaghan
2. Mega STe motherboard - Doc Clue
3. Guderian (8bit game) - JeLLe

Glad to be of service, folks! :)

# 815. Display problems under plain TOS

Newsgroup: comp.sys.atari.st
Date: 2007-04-07 15:07:06 UTC
From: "J.-Luc" <Myname.Mysurname@myisp>
Message-ID: <4617b39a$0$27400$ba4acef3@news.orange.fr>
Source record: 5729

Hello,

This problem only occurs under plain TOS, on my FalCT60, but I noticed it on my old MegaST-4 with Crazy-Dots : when in high resolutions, 1024x768x256 for instance, the amount of files displayed into an opened directory window differs from the one it really contains.
The problem can be seen (in french only, sorry) here :
http://site.voila.fr/cejiel/Copies_ecran.htm
The 1st screen shows what is displayed under MagiC!, 1024x768, but it has no importance, and, moreover, I opened D: partition instead of E: :-(
The 2nd one is more relevant : it shows that only 20 objects are displayed into C:, while the status bar states there should be 39, and D: displays only 6 objects instead of the 11 stated.
If I could increase the resolution, there would be even less objects displayed.
Did someone ever notice this strange behaviour ?

Regards, and merry Eastern,

J.-Luc

Some HP printers are fine working this way, others get upset. There used to
be a document on the web listing which were OK and which were not, but I
don't have the link handy or the time to search... I know the BusinessJet
1100's we have at work are OK like this, but I also know we had issues with
some older printers....

>

If its like the 1100 it ships with "standard life" print heads (not
cartridges) which I think are good for about 10,000 sheets. They are not
cheap to replace, but on the 1100 you can get an extended life version....

OK, then I'll give it another try and upload the zip file.
It contains docs in both german and english.
It's a TTP karaoke program for TOS.

I found what was wrong : there was garbage at the end of my aFTP host
file, where the new adress of the server was recorded, that prevented
the connection to achieve :-(
I edited it and cleaned it, and could upload the zip.

My understanding is that it will plug to the ACSI port, whereas the satandisk will plug into the cart port. So you can have the cart port free for an ethernec/netusbee :)

I'll put you in the 'maybe' list then!

## 821. Backup?

Hello,

wow, this is really funny ;-) It happens probably only at higher
resolutions since I use 800x608 for ages on my falcon and no similar
behaviour.

Maybe trying Teradesk would be a good idea and if here is ok too, it's
definitely bug in TOS.. Btw what TOS version did you use?

Know what ? this is a really sensible suggestion! I'll try it asap :-)
It's TOS 4.04, but it happened too on my MegaST-4, with TOS 2.06 (it
was bi-TOS).

Thanks,

Hello again,

To make it short : it was a problem with TOS altering NEWDESK.INF
when saving it :-(
Editing the file and cleaning it made the 2nd part of the files
accessable with horizontal slider (when, previously, date and time
was displayed, as I set them to be displayed).

Just a change, if I may?

Cheshunt Computer Club should be the URL listed in my sig. The direct
one may change in the future, which would could lead to people
floundering :-)

Any space on your list for DDP Translations? http://ddp.atari.org

I know it hasn't been updated for some time.

Thanks for this resource!

It will only display the logo if it can initialize the graphics card
properly. Try using the card that came with the machine, since it's
not compatible with all Mach64s and ET6000 cards.

Source record: 5658

Hello from France Axel.

I've had similar issues in the past. Two times, I got the MB repaired
but I also managed to 'repair' it successfully a few times.
Some suggestions :

- remove all the RAM modules, let only one and change it with the others
- unplug your FD, I had this issue one time after plugging an additional
720 Kb FD with the 1.44 Mb one
- unplug all drives (HD, CDRom). First thing to do is at least to have
a screen with the boot logo.
- check the pins of the oscillators (or quartz, I don't know the english
word). Easy to remove.

Now what helped me the most, but a bit more difficult :
- try to find a product called 'KF contact', or equivalent.
- remove the CPU (try to get the tool for that, it is fragile)
- remove all the the Xilinx chips. This can be done with a bended wire
of strong metal, small diameter of course. Take them smoothly out of
their support. Another time, be extremely carefull when doing that.
And before to unplug them, note the position.
- remove all the chips that are not soldered, carefully again
- Using the KF Contact, 'wash' the chips and the supports. No need to
dry them, the product disappears almost immediately
- pressurized air can be usefull to remove the dust that can create
shortcuts
- I have read that the chips on the MB are "cold soldered", instead of using
liquid metal, wave soldering. It seems that this is making the contacts
not very reliable. Using the KF contact on the entire MB won't hurt it.
- Replace all the chips, light a candle and power it up.

If you don't feel comfortable with that, ask someone else of course.
This is what I did several months ago because my H60 was freezing very often.
Since then, it is running like a charm (I touch a piece of wood like we say
in France).

After that, if there is still nothing, get it repaired. Freddy Aschwanden
is not repairing them any more, AFAIK, and the guy in Paris who repaired
mine has retired. May be Rodolphe CZUBA can give you helpfull informations

I hope it will help you

Best regards.

Hi Folks,

My Falcon has a dead clock, and it has the MK48T87B. I ordered a
replacement online and received a Dallas DS12887+. I'm hoping that
someone will know enough about these chips to answer a few questions:

1. This is pin-for-pin compatible with the MK48T87B, I hope. Is that right?

2. The MK48T87B has all of its pins. The DS12887 has some gaps, there
are a total of six missing pins, some on either side. But if #1 is yes,
I'm guessing that these are extra grounds on the MK48T87B. Is this right?

Rather than attempt to desolder the old chip, what I'd like to do is cut
the current chip out by using a dremel tool to slice off the tops of the
pins close to the chip's plastic. Then I can solder a 24 pin socket on
top of the existing pins.

I've heard of this being done before, but I'll need to be very careful
to avoid damaging the traces on the motherboard. I believe I can
protect the traces by cutting some thin but sturdy material to the right
width and sliding it underneath the IC to function as a shield.

Any thoughts on this approach?

Personally I would (and will) desolder the IC. I have 2 of them to do
this week. Just remove the board and carefully (also quickly) desolder.
I am considering putting in a socket, but it will depend on clearance
under the keyboard for my stock model. Will probably socket the towered
Falcon. Considering the cost of a new Falcon board you might want to
take it to a electronics repair shop.

Thanks Mark.

Mine is in the Falcon Rack case, so clearance isn't a problem.

Fortunately there is space around the clock chip on the front of the
motherboard so there's some room for work.

24 pin sockets are getting hard to find. I used to be able to buy one
in town. Now I get to find out what it costs to ship a $2 part... :p

Since you're obviously happy with a soldering iron and such, why not consider taking the top off the NVRAM chip and wiring up a CR2032 coin cell in a holder instead? This has been mentioned in here or in c.s.a.tech many times before.

Source record: 5668

Folks,

I have built an Eiffel board with the latest firmware from
http://perso.orange.fr/didierm/. and it seems to work pretty well apart from
an issue with the Joysticks. The only game I could find that loaded on my
old MEGA was an old copy of space invaders. It seems to work fine apart from
it ignores the Joystick fire buttons. I notice that it says on the firmware
web page that the "IKBD_SET_FIRE_BUTTON_MONITOR" call is not supported.
Could this be the problem?

Any one else tried this program with an Eiffel? Any thoughts on another good
test program? Any that will run on a TT?

Oonce you have sliced the top of the chip I would have thought that the pins
could be removed with a solder pump fairly easily. This was the approach I
took with my STE when I replaced the DMA chip.

I agree. You don't need a new clock chip -- your clock chip needs a
new battery. If you don't want to desolder, I would strongly consider
just wiring in a new battery. Frankly, I if I of little electronics
background can accomplish the battery replacement, practically anyone
can.

Hi Derryck,

This approach didn't work for me. On advice in another message, I tried prying up the upper half of the MK48T87B.

Unfortunately, I found that the battery and other components were embedded in solid plastic in the upper half. It was filled with a kind of epoxy. Prying it loose pulled its very thin leads out of the lower half of the chip, so there's nothing left to work with.

I'm not sure if this is how they all are or not, but those leads are extremely fine and would have been difficult to solder. I looked at the example image someone had posted, and the interior of my chip doesn't look anything like that. There were no components mounted on the lower half.

Thanks for the advice.

You can get a larger 40 pin socket and cut off the unwanted pins.
Another trick I will be using;-)

Ouch! At least nothing was lost, apart from your time :-/

The NVRAM chip that I witnessed being replaced would have lent itself
very well to this approach. Its replacement was sourced as a free
sample from Maxim, I can't recall the actual number any more.

I would probably suggest desoldering the entire chip rather than
bodging by cutting through/soldering to the original chip's pins. The
risk of metal swarf...

# 861. [UTD] ARAnyM's Pack Major Update

Newsgroup: comp.sys.atari.st
Date: 2007-04-12 11:18:38 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <461e158e$0$27397$ba4acef3@news.orange.fr>
Source record: 5675

Hi,

There's a new binary version of EmuTOS that is available from

<http://atari.sk/download/falcon_os/emutos-512k-0.8.2.zip>

We can read at <http://atari.sk/>

"
New version of EmuTOS is released. EmuTOS is a GEMDOS compatible
operating system for Atari ST series computers. It is made from Digital
Research's GPLed original sources and will be a free and open source
replacement for common TOS images.
"

It changes a lot in speed and compatibility comparing to all
what was made before it about compatible TOSes. Just testing :-)

I made it available in <http://eureka.atari.org/MacAranym.zip>
a Universal Binary mini pack for OSX that works "out of the box"

And in <http://eureka.atari.org/xa-my-aes.zip> a disk image that
offers a compatible environment for all other ARAnyM host platforms.

I let you comment this major update. Greetings to EmuTOS Team !

Best regards,

## 863. Can't find TELSTAR telnet program for download!

Newsgroup: comp.sys.atari.st
Date: 2007-04-13 00:54:05 UTC
From: afoster@hylobatidae.org
Message-ID: <461ed4ab$0$763$4c56ba96@master.news.zetnet.net>
Source record: 5677

So, a slightly crazed moment of boredom resulted in my old Atari ST being taken out the cupboard, dusted down, hooked up to a VGA monitor and generally being fussed over for a bit. Its hard disk has been imaged and Hatari-ised, while the mouse has been thoroughly spring cleaned.

Also, since alcohol may have been involved - the end result is that my ST is back on the internet, after almost a ten year absence!

(Running STiNG, routed over a null modem cable to a Linux PC assembled from odds and ends and hooked up via ethernet to a switch then ADSL, and in itself being controlled remotely from the wireless MacBook Pro parked on my lap. Of course!)

Anyhow, I've seen lots of recommendations for a 'Telstar' telnet program - it sounds like it might be marginally more reliable than the crashy TVT one I just found. Trouble is, all the download links appear to be dead.

Since about the only even slightly useful task I can think of for this ST is as a not-entirely-dumb terminal, does anyone know where I might find it?

Cc:ing to my hylobatidae.org address would be greatly appreciated, as all this elderly computer hardware is making the house a bit on the warm side. Do avoid the email address in the signature below - I thought I'd leave my signature intact to demonstrate True Atari Leanings. ;-)

Many thanks,

Adam

Top posting. All copies of telstar.zip are munged. There is a telstar.lzh
to be found by ftp to kurobox.servftp.net:3021, or as a dotted quad
213.118.244.69 port 3021, however your ftp program does that, and that one
is not munged.

Brilliant FTP site, thanks - but alas, this fabled Telstar telnet
program seems even worse than the first one I tried!

(It *looks* very nice, but it seems fixed in its line-input only mode
which makes it impossible to use BBSes etc, and managed to lock up
after I pressed a configuration button. Ah well...)

Still, lots of other interesting stuff to explore on the site,
including a rather nice and simple, command-line FTP program!

Guys,

Developing a bittorrent site devoted to distributing classic computer related material - it's in test mode at the moment at http://landover.no-ip.com:6969 - test it out if you will (try uploading too). Any comments (good, bad or otherwise), there's a forum attached.

cheers,

Lance

## 872. basic language retropedia

Newsgroup: comp.sys.atari.st
Date: 2007-04-14 22:54:53 UTC
From: proteanthread <post@newsgroups.net>
Message-ID: <oJudnYgMVKLTwbzbnZ2dnUVZ_u6rnZ2d@bresnan.com>
Source record: 5686

http://rtdos.com/tiki-index.php?page=The+BASIC+Language+Retropedia

working on a retropedia of sorts for the basic language; what we are trying to do here is create a xref system of the different commands each dialect of basic used and how each dialect of basic used them. we're trying to cover all basics for all machines (from the first machine that used basic up until as recent as possible or feasible); back in the early to mid 80's there were TONS of books on the subject and we're trying to re-create that here (since most other classical computing sites contain information on the various machines we are trying to gather programming information on these machines so, no, we're attempting to NOT duplicate the same information on other sites although we'll link to these sites when necessary, possible, and or allowed by these other sites).

Aly,
In that case I think I need to go debugging. A quick check on the comments in the source

http://perso.orange.fr/didierm/

seems to match the circuit diagram on the web page, but there are some comments about joystick-0 and LCD display. Pity they are in French, and I only have a CSE 2 (I thats about a GCSE Grade D) in French from 38 years ago. In fact I guess that when I learnt French the word "Joystick" hardly existed!.

Actually I think that might be the issue as I was thinking most games used joystick-1 so you could leave the mouse in port-0, but its so long since I played an Atari game on a real Atari I am not sure even which port maps to which joy stick...

Any way most go and take number 1 son back to Oxford, so may not get time to try today...

Dave.

## 874. Telstar

Newsgroup: comp.sys.atari.st
Date: 2007-04-15 18:49:20 UTC
From: Jim DeClercq <jimd@panix1.panix.com>
Message-ID: <evts3f$mul$1@reader2.panix.com>
Source record: 5688

Telstar works for my purposes, and so does TVT102, which is also almost as stable as the proverbial rock. TVT102 needs a GDOS to run on, and this message is being written by TVT102, running on a Stacy. The GDOS.PRG in use has a file length of 8853, and probably came from the SLM Diabalo distribution.

It may be that not all versions of GDOS work well with TVT102.

Yes, I know what Telstar does, which is not what is wanted for using nonstandard telnet ports. The copy on that server is my personal copy, which went there after I found that all zipped copies anywhere did not unpack. It is what I use on a TT030 with a TTM195 monitor in single tos.

Jim

Hi,

Can someone confirm that jumper W105 on the TT Ram board is used to set
Burst Mode?
And is it: 3-2 Burst Mode
And: 2-1 Non Burst mode?

If so, my TT Ram was sold to me ten years ago in Non Burst mode! Can I
change the setting without any problem?
I have a TT with CPU on the motherboard, and I have a CaTTamaran
accelerator.

Thanks,

Guillaume.

Thanks! that's it: Non burst mode on mine.

Yes, that's what happens! a line of "X" at boot time. And doesn't
work... Have I other SIMMs? Not so sure...

Guillaume.

# 887. Re: Networking under MagiCMac

Well last night I tried running the demo of MagiCMac 6.x for OS9 in the
Classic Envirnment on my G5. All I got after the spash screen was a white
screen and the system froze. Not good I'll try with other version of
MagiCMac that I have and see what happens.

You can start by emailing the enemy with the wrong place to meet with an Atari. When he gets there, clock him over the forehead @ 1.79Mhz and then cut him up with an Atari 800 cartridge door heat sheild..

Yes (as other folks have already reported).

>And is it: 3-2 Burst Mode
>And: 2-1 Non Burst mode?
>

Yes, with the pins numbered from the right when looking at the W105 the
right way up (i.e. pins are 3-2-1).

>If so, my TT Ram was sold to me ten years ago in Non Burst mode! Can I
>change the setting without any problem?

The SIMMs have to be nybble-mode DRAMs. There was a good explanation of
all this by Howard Chu many years back - I have the article printed out,
but I'm not sure if it's still online. The conclusion was that,
although burst mode can transfer 4 longwords in 7 clock cycles (compared
with 12 clock cycles in non-burst mode), the 68030 burst implementation
has very limited impact on performance. This is because:
. the 68030 only performs burst accesses when filling its instruction
cache; data fetches always use non-burst mode
. most of the time, needed instructions are already in the cache

BTW, I checked two TTRAM boards, and neither had "burst mode" set. I
suspect that burst mode TTRAM boards are pretty rare ...

Hi,

A Major Update of <http://eureka.atari.org/MacAranym.zip> has been
released that has to deal with compatibility and efficiency related
to EmuTOS 0.8.2 update.

This *Mini Pack* designed for OSX is a /Universal Binary/ *ARAnyM*
version working "out of the box" for all machines OSX >= 10.3.9
including x86 and PPC CPU.

I let you comment this major update :)

<http://eureka.atari.org/aranym.gif> is a live screenshot of my
proper dual-G4@1.25GHz, running with MacAranym as a Guest Star B-)

Enjoy it !

Yes, Ozk's driver works on the Milan. I can vouch for that. However,
ask Ozk directly for the latest driver as I believe the one on his
website is quite old. I no longer own a Milan so I can't be of much
help. Ozk's driver needs a Sound Blaster with the ES1371 chip. Make
sure you have it.

Joshua.

Strange. Is this another branch? I expected this stuff to be present
in the CVS... It should be afaik.. last time I browsed the CVS
sources, I'm fairly sure it included the img-decoder for the window
textures... well, worth looking into.

No, nothing wrong with config, if you count using other VDI's than
NVDI a config problem. The reason for this is that only NVDI have the
necessary vdi calls used by pdlg_xx wdialog functions.

Because fVDI I'm using doesn't support these system calls, is there
something more I can do if there's no config variables to modify ?

Would I just suppress C:\ALERT.ACC so that XaAES be quiet ?

Thanks to help.

I noticed that too. You're using a non-up-to-date XaAES, and you could
try downloading a bug-fixed QeD at xaaes.atari.org...

Forget what I said. I thought the XaAES dialog said 2005... sorry.

# 919. [ANN] Studio Son 2.092 beta FR & UK

Newsgroup: comp.sys.atari.st
Date: 2007-04-22 22:00:41 UTC
From: DOCs <"docs ifrance.com">
Message-ID: <462bdb0e$0$25891$426a74cc@news.free.fr>
Source record: 5633

Monday, April 23th 2007,

Election of the President is not the only event of these days in France.
There is also the new release of Studio Son for your Atari Falcon.
The audio editor for Atari Falcon becomes more and more stable and
reliable with this 2.092 beta version. Another bugs of general use have
been fixed.

Studio Son 2.092b is available in the wonderful french language:
http://doyeuxyvan.free.fr/studioson/std2092b/STD2092F.ZIP

The english version can be found here:
http://doyeuxyvan.free.fr/studioson/std2092b/STD2092E.ZIP

You can, of course, find the classic 68030 and 68030+68882 versions in these
archives.

I have performed a lot of hard tests to check the quality of my algorithms.
I have written a lot of different DSP and C programs to obtain correct
results. But, it is still a beta version, so be careful with your samples !

This version has been tested with an original Falcon 030 with a 68882
coprocessor. The CT60 card is not officially supported.

```
-----------
Bugs fixed:
-----------

- AU/SND files header write error fixed.
- Several loop errors.
- The approximative hi-speed play has been disabled.
- Icons draw bugs.
- Intempestive play.
- DSP effect restore bug after effects changes during a play.
- Reverse stereo with Invert function.
- Block undraw after a Scrub.
- Undo after the "Replace" function.
- Reverse stereo of echo-delay DSP effect.
- Record from cursor.
- Pause with SPACE while recording under Magic.
- Many another minor bugs.

----------------------------
New features and bugs fixed:
( since 2.09b version )
----------------------------
```

- Rewritten "Apply Effect" function. Studio Son does not need a temporary file any more.
- You can now create with "New Sound File..." blank AIFF, WAV, TRK, SND and AVR files. WAV files created are always 8 bits unsigned and 16 bits signed with little endian format ( Intel ). Either are always big endian format ( Motorola ).
- You can create you own sample frequency.
- New management of external DSP effects.
- New useful alert boxes added.

- Crashs when filtering under Magic fixed.
- For a resample process under Magic, internal file management fixed.
- Significative noise reduction of plopping sounds as long as you use Studio Son.
- Management improved of AIFF files compatible with Cubase Audio. These files are now saved with a physical size rounded to 1024 bytes multiples. Useful to prevent crackling noise when you import your AIFF files with Cubase Audio.
- Buggy "Scrub" function rewritten. No crash occurs.
- Reverse stereo bug for a "Scrub" fixed but still in beta test mode.
- Buggy "Cross Fade" function improved. Autocorrection for wrong parameters. The UNDO is also correct.
- Cut, Copy, Paste, Insert and others have their UNDO bugs fixed.
- Bug of the current working folder fixed. ( After an Insert for example )
- DSP effect after a Resample and Filtering is now restored with no problem.
- Overall settings saving are now re-enabled ! Up to date, you MUST keep the STUDIO.SYS folder.
- Rewritten "New Sound File" function. You can now create a file with the fileselector, choose a frequency, ...
- Rewritten "Apply Effect" function. Sample gap subtly fixed. Due to the DSP real time application of this function, it is obvious that it remains a very small gap into your final sample. This gap is usually filled by zero values as it has been thought for this rewritten function. So, it's not recommended to apply an effect to a block selection.
- Markers management bugs fixed. ( Delete, saving and loading procedures )
- There was play error with "Preview Cut" function. It's now okay.
- Block selection with SHIFT+TAB to the next marker has been debugged.
- Sample time length is now updated after any UNDO.
- Little bug fixed during a play actived by the space bar with an exported sample from Studio Son.
- Resampling function added ( Linear Interpolation ).
- Resampling function includes a filter and linear interpolation code in only one DSP program.
- You can resample from 2 Khz to192 Khz.
- WAV files opening issue fixed.
- Huge undo bug fixed.
- Huge bug of the volume of mono samples filtered fixed.
- FIR filters ( Low Pass, High Pass, Band Pass and Band Reject ) up to 2048 coeefficients.
- Resample process can be followed by a LowPass filter up to 1024 coefficients.

- DSP Filter algorithm improved. The speed of the treatment have been
increased. Now you can enjoy a good optimization of the filtering process.
- The end of the sample is now truly filtered.
- Vu meter clipping problems fixed.
- The cursor running is now correct when sample frequency is not the same as
the system frequency.
- Desktop background pattern modified to improve the work in monochrome.
- Redraw bug of the desktop in monochrome corrected.
- Several dialog boxes fields bugs fixed in monochrome.
- Crashs at very high zoom levels fixed.
- You can now really select all the sample with the mouse.
- You can now really place the cursor at the end of the sample with the
mouse.
- Wrong size of the blocks at the end of the sample corrected.
- You can now create a block with a "one sample" size when you make a long
click on a part of the sample.
- New alert boxes for the Filtering and Resampling function.
- New internal undo for the Resampling function.

New function "Resample..." allows you to change the frequency of your
samples with a linear interpolation and an optional Low Pass filter.
The "Filtering..." function enables you to carry out FIR filters ( Low
Pass, High Pass, Band Pass and Band Reject ).
This is performed by the DSP 56001 and with Direct to Disk process.

-------------
Known bugs:
-------------

- No sound when playing very high frequency samples.
- Slowly WAV files opening.
- Selected block after a resampling task is not deleted.
- Sample duration and time counter are wrong when the system frequency
doesn't match with the sample frequency.
- Unable to reduce physically the size of a sample when you cut blocks.
- In the time counter, the value 99 is followed by 10.
- Several little bugs into the sample window.
- The icon of the function "Generate Low Frequencies" differs with the
colour of the resolution.
- Little bugs of sample drawing.
- Random error messages when filter steepness is very low.
- Minor bugs.

Up to date, you MUST keep the STUDIO.SYS folder with Studio Son
program file.

If you are using Studio Son on a single TOS, I strongly recommend the launch
of ARROWFIX.PRG in the AUTO folder:
http://doyeuxyvan.free.fr/studioson/std2092b/arrfix15/

If you are using NVDI, just run ARROWFIX.PRG after this.
Otherwise, GEM must be copied in RAM with the program GEMRAM.PRG before

running ARROWFIX.PRG:
http://doyeuxyvan.free.fr/studioson/std2092b/GEMRAM16/

If you have troubles to run Studio Son under Magic, you can use the patch
DSPSLOW1.PRG by Centek included into the package or you can find it here:
http://doyeuxyvan.free.fr/studioson/std2092b/DSPSLOW1.PRG
Don't run DSPSLOW1.PRG if you launch Studio Son under TOS otherwise you
might have display or DSP locked issues.

You can also use the nice DSPXBIOS patch by Didier Mequignon:
http://perso.wanadoo.fr/didierm/files/dspxbios.zip
http://doyeuxyvan.free.fr/studioson/std2092b/dspxbios.zip

If you use an external clock, run FDI_INIT.PRG into the AUTO folder:
http://doyeuxyvan.free.fr/studioson/std2092b/FDI_INIT.PRG

FPATCH2.PRG is now included in the package.

You can also download self-extracting STZIP unpacker:
http://doyeuxyvan.free.fr/stzip26/STZIP26.TOS

Have fun !

Yvan Doyeux

LOL.

There are VGA adapters for the ST (high res only) on ebay, a polish
guy makes and sells them - I bought one off him so all ok, do a
worldwide search for ST vga

It's kind of stupid, but if you have PC with video in (on the graphic card or on the TV tuner card you can plug composite video out from Atari ST in there). Don't expect very good quality. So you need whole PC to work like an adapter for that option. Obviously it's overkill.

There are others who make these. If you want to show color then perhaps a
frame doubler:-

http://www.faqs.org/faqs/atari-8-bit/faq/

and serach for scan doubler

"scan doubler"

In case anyone was staying awake nights wondering what had happened, my chip replacement surgery was a success.

Three of the pins stubbornly refused to give up their solder, so I used a chip puller to apply pressure to the side of the chip that had one remaining pin while heating the pin. This allowed me to pull one side of the chip. Then I heated the other two pins back and forth while continuing to tug on the chip until it gave way. I used some desoldering braid to remove the remaining solder so that the IC socket could be installed.

As someone else mentioned, a 40 pin socket can be shortened for use as a 24 pin socket. This works well with the sockets that have a plastic bridge across the middle; fortunately my nearby Radio Shack had one of these left.

I also used a brush and dust blaster to carefully remove all of the desoldering debris after I was done. There were several small bits that wandered down the circuit board as I was working.

After I had replaced the clock chip and powered up the first time, I thought something was b0rk3d because at the end of the boot process I had a small dialog pop up that said "AES Error" and had a single button labeled "Abort". Clicking this button just made the dialog reappear.

But after I hit the reset button once, booting continued successfully to full completion.

I was able to set the date and time and save them, and saw the time moving forwards at the customary rate. I shut the power off for twenty minutes, powered up, and had the thrill of seeing that correct time was displayed. Hooray!

The only problem I have now is that whenever I tell someone about this achievement, they say "My G*d! You're still messing with one of those things? Don't you have anything better to do with your time?!" ;)

-dreq

Most certainly.

ST High -> VGA is a simple matter of making a cable. Here is the
(edited) copy of a post I made about four years ago:

... ST High is NEARLY the same as monochrome VGA, so you can get
a simple adapter cable and any VGA monitor that can handle multiple
resolutions. Pretty much any one I've seen made after 1998 will be
able to display it. You won't get STLow or STMed though.
STHigh : 35.7 KHz, 72 Hz refresh, 1.0V max
Standard VGA: 31.5 KHz, 60 Hz refresh, 0.7V max

Here's what I found on the web (note, I haven't tried this myself):

ST to VGA (ST High)
-------------------
ST pin number VGA pin number

9 ( H Sync ) --------- 13 ( H Sync )
12 ( V Sync ) --------- 14 ( V Sync )
13 ( GND ) ------------ 10 ( GND )

10 ( Mono Out ) needs connecting to VGA pins 1, 2 and 3. If
your monitor doesn't have a setting to handle a 1 V signal (mine can
switch between 1 V and 0.7 V) you should use a 75 Ohm resistor for
each of the R, G, B signals connected to MONO OUT -- however, most
monitors I've seen don't get harmed by a 1 V signal (they're just a
bit bright), so if the monitor is relatively inexpensive I would
consider the last step optional.

The following pins also need connecting together on the VGA
connector:

4? ( Monitor ID Bit 2 ?) -- This pin may or may not be needed,
depending on the monitor.
6 ( Red GND )
7 ( Green GND )
8 ( Blue GND )
10 ( GND )
11 ( GND )

The following pins also need connecting together on the ST connector:

4 ( Mono Detect )
13 ( GND )

As for VGA Low or Medium, European users can use the SCART connector (so I'm told). We Americans have three choices:

1) Use the TV (composite) output to a computer or monitor that can handle a TV signal. (This is usually a poor quality solution for ST Med, but is OK for ST Low.)
2) Use a scan doubler. (These are generally available at electronics stores in the video games section. Look for something that is designed to let you play your PS2 or GameCube on a VGA monitor. (This works great for ST Low and OK for ST Med.)
3) Use a monitor that can natively handle the ST's resolutions. Unfortunately, the only ones I know of that have been made in the last fifteen years are very expensive, as they are made primarily as replacements for displays of large-scale equipment (power plants and the like).

On interesting solution is to use a LCD TV/Monitor. Many of these have a composite in (good for ST Low) and a VGA in (good for ST High). Of course, should you go that route, a native resolution of 640x480 or 1280 x 960 is suggested to avoid rescaling issues. I've seen several TVs that would fill the bill, but you'd have to create a cable with a toggle to change resolutions (or use the old "Monitor Master" device.

Not sure about the usefulness of that accessory. Any reason why you
use that?

There is a configuration in xaaes.cnf called 'alert_windows' wich you
can use to shut alerts up. Look it up in the example xaaes.cnf found in
the cvs source tree.

## 934. TT Hard disk

Newsgroup: comp.sys.atari.st
Date: 2007-04-25 14:29:22 UTC
From: blah@blah.com
Message-ID: <4vou23p59g5cfl0egg3jsulbaeqfj2ec78@4ax.com>
Source record: 5648

Hi,

Pretty sure the hard disk in my TT is dead as a Dodo.

What options have I got to replace this? The one inside it is a
Quantum Discache from 1988, I'm not even sure of the capacity.

The SCSI connector on the back has 50 pins.

Can I just pick any 50 pin SCSI drive from Ebay and plug it in?

Also I have a couple of external 18gb HDs in rather solid cases made
by a company called "Blue Disc" They are the 68pin types with a plug
in terminator. If I just pull the dead HD from the TT what else would
I need to use in order for this to become the main HD? Would I need
to set some sort of termination on the TT itself?

I have HDDriver 8.18 for the setup/partition.

Thanks in advance

Dave.

Source record: 5552

Ok, thanks.

Just tried this with a 100mb ZIP and a TT. I partitioned the ZIP and formatted it, I then installed HDDRIVER.SYS into the root of C: (The ZIP), I checked that the boot drive was set to C: and then rebooted without a floppy in A:

Message reads "No partitions found".

Even running HDRUTIL.APP from the A: drive now cannot find the C: partition.

Is the procedure for using a ZIP as the C: drive exactly the same as it is for a normal HD?

Thanks
Dave

Almost every 50 pins SCSI HD should work but... I have a Seagate
Barracuda KLGSPR drive that I never could manage to make work on
my TT, while it did on my Falcon :-/
>

You need a 50 pins to 68 pins converter - give me a few days, and
I give you the exact ref of the part ;-)
I'm currently using an IBM Ultrastar DCHS04U drive, which is 68 pins
single ended fast/wide with such an item, and it works fine :-)
Note however, that under plain TOS you will only be able to use the
12 first GBs (512x24, assumed that you don't use any other drive
such as CD), so ther will be 6 GBs lost :-(
Only MiNT or MagiC! will let you use the whole available space.

I feel your pain. HD Driver or the ICD utilities have always made it easy to get another drive working though. Granted in the last time I tinkered with it I got a 120 mb old Mac drive working, but then I didn't need to do much on the TT I have. But later I might add more.

Always wondered about using one of those IDE to SCSI converters, could be fun. :)

Any SCSI-2/3 drive that can somehow (without adapter if the drive has an
8 bit bus, with adapter if the drive has a 16 bit bus) should work with
the TT and HDDRIVER.

Yes, it's exactly the same. You should check your cables and
termination. The problem you observer could be a termination problem.

Cable is ok and the ZIP is terminated. I've not changed any
termination on the TT itself, mistly becuase I don't know how to.

Ok so if I boot from the ZIP drive can I then switch ZIP disks once
the system has booted? At this stage I'm just using TOS.

I've found a SCSI cable which has the (Centronics?) 50 pin connector
on one end for the TT and 68pin (Wide?) connector on the other end.

Is it just me or are all the different SCSI connectors confusing?

In another thread regarding a ZIP question Uwe mentioned 8 & 16bit
bus... Argh!!!! ;-)

>Note however, that under plain TOS you will only be able to use the
>12 first GBs (512x24, assumed that you don't use any other drive

Right so it's ok just to use the first part of the disk? Unused space
is simply that, unused space.

>Only MiNT or MagiC! will let you use the whole available space.

That's one for another day.

Cheers
Dave

50-pin SCSI = 8bit
68-pin SCSI = 16bit

You can easily use 16bit drive on 8bit bus.

The cable with 50-pin connector on one end and 68-pin on the other
would work for you.

Joshua.

I can't recall if you can set all available ID numbers on the ZIP
drives. If you can't set 0 for it, have you enabled its ID in HDDriver?

Re your termination question, the ZIP drives have a switchable termination.

Hi!

Is there any decrease? I mean, does the HD read two times 8bit or can it internally change to 8bit operation, so that 'words' come in a row with/to 'bytes'?

Having some more silent (other 1-2GB SCSI-HD's I have, 50pin SCSI-II, are mainly loud and crappy, vibrations etc.) drives here around, but with the HD-Socket 68pin...

Best regards,

Daniel Mandic

P.S.: HDDriver (Uwe Seimet) would be obvious then, yes? (having a 4,3GB IBM 5400upm modern [~98'] silent and an IBM 9.1GB old style [~94'-95'] full height! copper striped, but with 68pin, too!)

Where is the difference between these alternatives? Instead of 16 bits
at once two times 8 bits are transferred. As far as speed is concerned
this is slower, of course, but with the Atari this is not relevant since
it cannot even make use of the full speed of an 8-bit SCSI bus.

Ben,
What leads do you have at present for your mega? If you have RGB out three phono plugs, then one of these:-

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=320106153232

may allow you to use your Atari via the S-Video input I expect the quality to be less than perfect. For best quality you need a more complex design such as:-

http://www.jrok.com/hardware/RGB.html.

For mono you need to use something like this:-

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=130104309364

Plenty of circuits for these on the net. You may actually find that if you feed the RGB into the VGA input it works. Trouble with Atari stuff, is that as you know , the volumes are so small parts are expensive....

Dave.

If there is an internal drive *and* an external drive the termination
jumper's on the TT' motherboard must be removed, otherwise they must be
present.

> Ok so if I boot from the ZIP drive can I then switch ZIP disks once
> the system has booted? At this stage I'm just using TOS.

You can do so as long as there are no applications that expect the same
data to be present on the boot drive that were present when booting.
Accessories, in particular, might expect that, but I have no idea if any
accessory actually does.
All in all it is basically the same like with any other (non-bootable)
partition: Applications should complain if they are missing something
they expect to find.

I think only 5 and 6 are supported. In this case, just as you say,
HDDRIVER must be configured accordingly, e.g. by using the "Auto
Configuration" option.

21 or 34 pin? (TV model numbers would be most helpful.)

I found this for the 34 pin (I have absolutely no idea if it is
correct) on the web. ( http://pinouts.ru/Home/sonyrgbmulti_pinout.shtml
)

Pin # Descrip
1,2 +5V
3 - 16 GND
18 T IN
19 N/RGB
20 H BLK
21 V SYNC
22 H SYNC
23 BLK
24 NO CONNECTION
25 B
26 G
27 R
28 Audio L
29 NOT MARKED BUT COMES FROM THE VIDEO BUFFER
30 REMOTE IN
31 NOT MARKED BUT GOES TO A TRANSISTOR BASE
32 Audio R
33 NO CONNECTION
34 INT/EXT

Since the Atari pinout is:
>1- Audio Out
>2- Composite Sync (or video)
>3- GPO ("General Purpose Output")
>4- Monochrome Detect
>5- Audio In
>6- Green
>7- Red
>8- Ground (+12v on some models)
>9- Horizontal Sync
>10- Blue
>11- Monochrome
>12- Vertical Sync
>13- Ground

Thus, I would guess your cable would have to be (ST -> Sony):

6 -> 26
7 -> 27
9 -> 30
10 -> 25
12 -> 31
13 -> all of 8, 9, 10, 11, 13, and 15

You could also use the audio pins for sound.

Hope this helps (and double check this with others -- I don't think I made a mistake, but it's not my monitor!)

Galen

Sers Uwe!

I understand. Yes that's the same...
But does it work otherwise? 50pin-to-68pin adapter (8bit SCSI drives to Wide host-controller).

How fast would it be (MB/sec), let's say with a 4.3GB UW HD and the adapter for 50pin SCSI, with HDDriver and the TT?

By the way, will any other SCSI devices work properly, with the 68-50pin Harddrive connected to the TT SCSI-Bus? So far I understand, it should just act like a real 50pin 8bit SCSI HDdrive. Can it even support different SCSI settings, like std.SCSI and Fast-SCSI 10MB/sec etc. (of course in an other, more capable controller, e.g. NCR53C810 etc.)?

In short, is it really compatible (wide drives with adapter to TT) as it were an 8bit SCSI-drive (older newer, anyhow, except the SCSI version of the Fireball QUANTUM ;)), with downward compatibility to older 8bit
SCSI host-controller, not able of Fast-SCSI, SCSI-II and such?

I have no adapter yet, just asking. Thanks!

Best regards,

Daniel Mandic

It's been a long time since I set up a ZIp drive for booting from :-)

I've just recalled that it matters which of the two sockets on the back
you use to plug the ACSI-SCSI converter into, which would tally nicely
with your earlier mention of cabling/termination issues.

Source record: 5580

Hi,

what I did with my Supercharger to speed it up:

http://perso.orange.fr/gtello/overclock_e.jpg (912 kb)

I removed the original 24 MHz quartz and put three of them (24, 30 and 36
Mhz) with a switch to select the one I want.
The CPU frequency is the third part of the quartz frequency:
24 : 3 = 8MHz, normal mode
30 : 3 = 10 Mhz, runs fine, +25%
36 : 3 = 12 Mhz, too bad, it hangs!

Maybe with a 33 Mhz one... don't know!

Guillaume.

Based on the above description, it should be:

9 -> 22
12 -> 21

The ST has no composite sync, so it can only interface directly to a
TV (or monitor) with separate sync inputs like the one described
above. Alternatively, one can build a sync mixer board, although I
have no idea where to find plans for this.

The maximum with the TT is about 1.8 or 1.9 MB/s with any drive not
older than about 10 years.

> By the way, will any other SCSI devices work properly, with the
> 68-50pin Harddrive connected to the TT SCSI-Bus? So far I understand,

Any device should work, and the TT (and Falcon as well) can make use of
any available SCSI-2/3 command.

Most of the older circuits use a simple resistor mixer to generate mixed sync. I think the ones I have have 2x330ohm resistors in from the seperate syncs onto the composite sync pin... See

Message-ID: <46344c80$0$27373$ba4acef3@news.orange.fr>
Source record: 5586

Hi,

I remarked there's peculiarities with XaAES and its way to
handle apps memory stack. So that there's stack overflow with
Papyrus or with SpeedoGDOS (when printing with my proper
software).

May XaAES be too strict in its memory stack management ?
It there's a way to increase the stack memory reserved
by XaAES for applications pool ? Can something be changed
in xaaes.cnf so that it prevents from stack overflow ?

When we have to deal with GCC built applications, we can
modify the apps stack with "fixstk.ttp" or with "stack.ttp".
But when we have Papyrus or SpeedoGDOS that always worked
correctly so far, and don't still work because of the
stack management, we can as ourselves what's going on ?

Can somebody help with XaAES stack memory overflow ?

Best regards,

Hi,

If we're speaking about graphic engines then

*"Aero"* is the graphic engine from Vista

<http://en.wikipedia.org/wiki/Windows_Aero>

*"Aqua"* is the graphic engine from OSX

<http://en.wikipedia.org/wiki/Aqua_%28user_interface%29>

Somebody would be attracted with *"Focus"* (meaning "fire"
in Latin language) the graphic engine from the ATARI GEM ?

We could combine elements :-)

ATARIstically,

# 981. CAFCRACK v1 (M) Crack For Cubase Audio Falcon 2.06

Newsgroup: comp.sys.atari.st
Date: 2007-04-30 22:04:09 UTC
From: Jean Pat <jeanpatataribatvoila.fr>
Message-ID: <463667e0$0$3184$426a34cc@news.free.fr>
Source record: 5595

Tuesday, May 1st 2007,

Minor update with the complete Cubase Audio 2.06 package including CAFCRACK.
Outputs of mixermap objects are switched to 'DSP'. It affects *.MIX and
DEF.ALL files. You can now enjoy a more easier work with the built-in DSP
effects!

More than ten years after Steinberg's withdrawal from the Atari Market,
here is a new crack called CAFCRACK for Cubase Audio Falcon 2.06.
Of course with this crack, you needn't the 128 bits key dongle plugged
on your Falcon. (OKI japan M7H007-024 SYNS0 E 3432351)
This crack is better than other existing Cubase Audio cracks on Atari.
This cute hack is the result of months of tough research.

Attention was turned to Cubase stability and data integrity which were
the lack of the other previous cracks.

You must understand that it's impossible to know if this crack is perfect.
If you encounter any bugs you can report them on Atari newsgroups or forums.

There are only 2 drawbacks (I think they are minor):
- Cubase takes up more memory (+25%).
- Each part or track data needs twice more memory size ( 192 bytes instead
of 96 ) but no influence on MIDI events.

But one thing is sure: this is the BEST crack ever made for Cubase Audio
Falcon!

You must put in the same folder CAFCRACK.PRG and CAF_206.PRG of your current
Cubase folder. CAF_206.PRG needs to be unpacked. If you are using the cubase
score editor, you must put a specific patched SCORES35.MOD file in the
MODULES folder. Be sure that the files attributes are not in read-only mode.
Data is written in SCORES35.MOD for each cubase launch with CAFCRACK.

You will find in CAFCRACK.ZIP:
- Unpacked CAF_206.PRG
- Patched SCORES35.MOD
- CAFCRACK.PRG
- CAFCRACK.TXT

http://jeanpatatari.site.voila.fr/cafcrack/v1/CAFCRACK.ZIP

# 982. TeraDesk 3.90 released

Newsgroup: comp.sys.atari.st
Date: 2007-04-30 22:27:38 UTC
From: vdjole@EUnet.yu
Message-ID: <f15qgo$f63$1@news.eunet.yu>
Source record: 5596

Version 3.90 of TeraDesk open-source desktop for the 16-bit and 32-bit lines of Atari computers is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

New features in this release are related to:

- Capability to set font effects (bold, italic...) in the font selector;

- Capability to recognize and handle (on suitable filesystems) executable files having names without extensions;

- Increased ranges of desktop or window background colours and patterns;

- Improved name-pattern matching, including the capabilities to specify exclusion name masks, and to use in single-TOS some wildcard options that, in previous versions, were available only in Mint/Magic.

Also, some noncritical bugs were fixed and a number of optimizations were made, so that, in spite of the added features, program size has shrunk to slightly smaller than in any of the the previous three releases.

See the history file for more information.

Have fun.

Djordje

# 985. Re: Stack Overflow with XaAES

Newsgroup: comp.sys.atari.st
Date: 2007-05-01 09:34:23 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <4637099F.7020604@atari.org>
Source record: 5598

Hi,

For a practical example of what I speak about, one can try
to launch

<ftp://kurobox.serveftp.net:3021/editors/papx_tos_demo.zip>

with <http://eureka.atari.org/MacAranym.zip> that was just
updated with Teradesk 3.90 (Thanks Djordje :) and you will
be reported an exemplary "Stack Overflow" from Papyrus X.

One can also try it with all other platforms hosting ARAnyM
and <http://eureka.atari.org/xa-my-aes.zip>

I suspect that it would happen on "Physical" ATARI machines
too. XaAES is having a huge consumption of USP without some
measures to increase the amount of this RAM User Stack.

Best regards,

Ok thanks, that explains a problem I had at the end of last year with
this TT.

Can anyone point me in the right direction for a TT motherboard
diagram and/or instructions on how to set this jumper? Is it easy to
get at? The reason I ask is that I usually kill electronics I take to
bits :o(

# 988. [ANN] CDLab 0.91 released

Newsgroup: comp.sys.atari.st
Date: 2007-05-01 22:00:43 UTC
From: DOCs <"docs ifrance.com">
Message-ID: <4637b895$0$31227$426a74cc@news.free.fr>
Source record: 5502

Wednesday, May 2nd 2007,

CDLab 0.91 is available.
http://doyeuxyvan.free.fr/cdlab/v0.91/CDLAB091.ZIP
A CD-R burning tool for Atari-compatible computers.

---
New features
---
- New audio formats for audio extraction. ( AU/SND, AIFF, AIFF Cubase Audio ).
- Filenames mask for audio extraction.
- Interface improvement in Monochrome.

---
Main features
---
- Audio track extraction.
- CD-RW blanking function.
- DAO (Disc-At-Once) copy for any single-session discs. ( But it doesn't work with my MMC compliant drive )
- TAO (Track-At-Once) multisession mode.

You need the SCSIDRV interface. ( already included in HDDriver )
You can also run this program before CDLab.
http://doyeuxyvan.free.fr/scsidrv/SCSIDRV.PRG

CDLab is now released under terms of the GNU General Public License.
The source code can be retrieved here:
http://doyeuxyvan.free.fr/cdlab/v0.91/

Original Francois GALEA website:
http://fgalea.free.fr/cdlab/

They are "SIL" resistors, not jumpers, and access is via the hard drive
cover. On mine I think there were three like the ones in the picture here:-

http://fabian.com.mt/RESISTORSdilSil.htm

Just remove from the mother board....

# 990. Wavelib 2.27

Newsgroup: comp.sys.atari.st
Date: 2007-05-02 09:26:03 UTC
From: Daniel Mandic <daniel_mandic@aon.at>
Message-ID: <4638592b$1$25622$91cee783@newsreader02.highway.telekom.at>
Source record: 5504

Hi!

Wavelib is working great. Sending receiving, no problems. No need to dismantle the Wavestation and find the tiny reset button (crashing regularly with a PC library program, do not remember the brand), not to mention the not-need of a second MIDI synth looped in, so that the crappy SB Gameport-MIDI finds the MIDI-IN of that specific Wavetable Synth ;-)
(might be a problem of an old ROM version... who cares, the ATARI MIDI Port can.). By the way, Cache of the 030 (TT030) is to be turned off, for proper MIDI flow control :)

Well, but how can I load .syx files with Wavelib, or .mid and .lib, found on Internet... ?
Do I need an other program?

Maybe something with menus, like Wavelib, please! Freeware if possible.

Best regards,

Daniel Mandic

# 991. Violent ATARI ST games turned many ST users into PSYCHOS!!!

The ATARI ST was a computer known for brutal, violent and
exceptionally gory games. Kids and young adults who used
to play these games turned into spree killers, rapists,
satanists, serial killers,terrorists and cannibals.

This is true. Many murders are committed by ATARI users,
this group is probably full of future mass murderers and
serial killers!!!

ST = deadliest computer ever!!!

Hey Rusty, thanks for the Falconspeed software. I replaced the Dallas chip and dropped the card in, works ok. BUT;-) My manual is in German, and makes very little sense. I was wondering if a English copy existed in electronic form somewhere. I can't even get the floppy drive to kick over under emulation. Nice touch with the reset tho.

Cheers

Mark

ROTFL. Getting excited, just dropped a few of the DBUG falcon hdd
install games on the old bird. Damocles, Magic Pockets and Stunt car
racer on a Falcon....wooooohoooo. Kicks PC off end of bench.......

I fell in love with Falcon's the first time I saw one. Lovely piece of
kit. This one has a 3gig hdd (might drop in a 20gig), 14meg chromagic
simm card, Falconspeed (of course;-) a new Dallas clock, a Piezo speaker
(original and chromagic card won't fit) and TOS 4.01:-p. I don't suppose
you know where I can get a Tos eeprom reprogrammed?

Mark

# 997. Thursday night IRC Atari chat 8 PM CST/CDT

Newsgroup: comp.sys.atari.st
Date: 2007-05-03 17:59:58 UTC
From: JellE <jelle@door.net>
Message-ID: <1178215198.470735.285050@l77g2000hsb.googlegroups.com>
Source record: 5511
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Hey everyone!!! We still have the IRC chat night going on each week, on Thursdays, if anyone wants to come in and check it out. Official gathering time is 8:00pm CST/CDT, and you have 3 options for getting in:

- Use your favorite IRC client to connect to irc.newnet.net and join channel #atari.

- Telnet from your 8-bit or other machine to irc.atarichat.net (216.37.55.109) and login as "atari". This will get you into the chat without the need for an actual IRC client.

- Use the Java applet found at http://www.newnet.net.

If you can't make it around 8:00 tonight, you can stop in at anytime, somebody is usually awake. We are predominately 8-bit folks... but a lot of us dabble in other stuff too. (Commodore, Amiga, STs, etc, etc, etc) There isn't much we don't talk about. It is a lot of fun....and very informative.

Hope you can come join us....we will be glad to see ya!!!

# 998. AD: E-Mail/Mailing Lists & Atari Survey!

# 999. New SAK webpage - preparing for NAS!

Newsgroup: comp.sys.atari.st
Date: 2007-05-03 21:49:13 UTC
From: GokMasE <gokmase@gmail.com>
Message-ID: <1178228953.034579.121640@y80g2000hsf.googlegroups.com>
Source record: 5513

Hiya,

Even though most of you guys in here might not understand that much of Swedish, I still thought I'd drop a line in here too. We have just launched a new website for SAK (Swedish Atari Club) which has a more modern look and also is a lot more interactive.

You'll find the website here: http://www.sak.nu/

A big reason to mention it in c.s.a.s is that our annual event, Nordic Ataris Show (NAS) is drawing nearer each day. This year, the event will be held between June 29 and July 1 in Gothenburg, Sweden. This is of course covered (in English too!) on our website:

http://www.sak.nu/nas/

You'll hopefully find answers to any questions you might have about NAS, but if not, feel free to ask away on the forum.

Thanks,

/Joakim

# 1000. UPDATE: New Telnet Information

Newsgroup: comp.sys.atari.st

i can tell you this from my own personal experience with rodolphe.
his stuff is first class.
he also comes thru. when you pay for his products a head of time. you
do not need to worry. you get the product in a reasonable time frame.
its as advertised, and its a first class product.
i have bought a ct060, a ct63, 2 100 mghrz 060's and a clock for the
ct060. plus he has me down for at least one pci slot, i will probably
fork out for two of them in the end.
on the other hand i have paid for a ethernac card at least a year
ago. i have never heard a thing since then. i may have to write it
off.
so in my opinion rodolphe and deidler, and some others have saved the
atari scene from a slow death.

the above guys are not some large corporation that can crank the
stuff out till the end of time.
i know they probably all have families and other responsibilities. we
should be happy we are getting what we have.
i can tell you from my own personal experience that we do a lot of
development work on atari 8-bits and the game machines. its slow work,
its hard sometimes to find parts and information, plus we all have
other responsibilities. so maybe rodolphe cannot snap his fingers,
and get one made.
i can tell you my falcons fly. when i flip them on, i am in heaven!
we are close to modernization once we get a graphics card, and some
slots.
so ask rodolphe politely. maybe he is tied up on other things.
but if he says he will do it. put me down for one. i have a tt030,
and i know from what it did to my falcons, my tt will fly!
hey, if he does a upgrade on the tt030, what about mega ste's? that
would really heat up the atari world. 3-060 machines available at
once.
thanks,
lance

Have you watched the postings on http://nature.atari.org ?

Latest as of April 24th is another 18 are finished and they would like
to send out 20, I hope this month.
I also paid well over a year ago.. September 24th 2005 to be exact.
But, I understand they had issues with the boards and they needed to
be fixed which is taking time.

But they are trying to give monthly updates on the website, so check
it out. Once and a while We will also post the latest on Atari-
users.net

Hi,

Found this on Ebay, a peripherial for Atari:

http://cgi.ebay.fr/ws/eBayISAPI.dll?ViewItem&item=280111420724&ssPageName=ADME:B:SS:FR:1

but I really don't know what's the use of it! Don't speak german at all...

Can anyone help?

Guillaume.

# 1009. Atari-Users of the world map

Hi Gang,

I added a new section to Atari-Users.Net today. It's a google
map for Atari-Users, aka a frapper map.
The map interface requires a modern browser (I think it's Javascript
based)

Log on and add your self to our Atari Map!

While logged in, zoom in on your location then select the "add" button
on the right side.

Thanks for adding your location!!

Rob

sorry forgot the links..

The direct link is http://www.atari-users.net/index.php?module=Atari-Users%20Map

Or visit

www.atari-users.net and select the "Atari-Users Map" in the Menu.

perhaps a e-mail from them with a notification about progress reports
on their web site would be helpful.
rodolphe kept me updated on every one of his projects that i
purchased from him thru e-mail. plus he posted stuff on his site.
communications is part of the answer to having a satisfied customer.
how i found out about the ethernat was thru rodolphe.
i never even knew they had a site. at least i know now. thank you.

# 1017. BigDOS

Newsgroup: comp.sys.atari.st
Date: 2007-05-07 10:13:17 UTC
From: Guillaume Tello <houten.van@wanadoo.fr>
Message-ID: <463efbbd$0$5103$ba4acef3@news.orange.fr>
Source record: 5531

Hi,

I'd like to install a 4Gb hard drive on my TT but partitions larger than 512Mb are refused, and 8 partotions is too much.

I've heard about BigDOS.

How to install it? Should I keep one boot partition with 512Mb and share the 3.5Gb for the others?

Is BigDOS compatible with Freemint+MultiTOS, FreeMint+MyAES, Magic6.02?

My usual system is the TOS3.06, but I sometimes use the others for testing purposes.

Any help is welcome,

Guillaume.

AFAIK it's the limitation of TOS 3.x ... TOS 4.x has this limit at 1
GB per partition

> I've heard about BigDOS.
>
> How to install it? Should I keep one boot partition with 512Mb and share the

if you use FreeMiNT, you don't need to install anything -- your >=512
MB partition will be visible without any problem :) The same for
MagiC. However, it wont be visible from TOS, of course.

I borrowed Wings Of Fury for the Apple II from a buddy in the late 80s. I thought it was the best damn game I'd ever played on that computer once I learned the controls.

Yet I really doubt the Apple II version was the best.

For those of you that have played some or all versions of Wings Of Fury, what's your take on which one was the best?

From: blah@blah.com
Message-ID: <vpk643l9io5aqmea8ubuogph5h4c41um6i@4ax.com>
Source record: 5543

Hi,

Ok before I kill my TT, by removing the wrong thing could someone
please sanity check what I have to remove in order for my TT to use an
external ZIP100 as it's hard drive.

The internal HD is dead and a 100mb ZIP would do just fine + I could
transfer files easily between my PC and the TT.

I've attached a photo with the HD cover removed. Is it the two (?!?!)
resistors at the top which are a rusty red colour?

Does anyone have a motherboard diagram for a TT?

Thanks in advance

Dave

thanks, I'll give the Amiga version a try since it seems to be the
most powerful platform WoF was ported to. thanks for the links also.

Hmm. Posting a yEnc picture worked in alt.test but not here...

Is there something different about this group?

I can email the picture if anyone has any thoughts on my original
post.

I can verify the Gameboy version isn't all that wonderful.

Stick it on a picture web site. SIL resistors usually have a dot or bar by
the common pin. When using as terminators there is a matching dot on the PCB
, or on some of the older drives the socket had a square surround,

http://rswww.com/cgi-bin/bv/rswww/searchBrowseAction.do?N=0&Ntk=I18NAll&Ntt=241-6413

What don't you know?

Do I pull both out of the board. It looks as if they are soldered but
I've not looked at the other side of the board. Basically I need some
advice on what is involved.

KNI Studio wrote:

> Ok, what is Wavelib ?

Hi!

A perfomances-librarian for the KORG Wavestation (various models),
which runs on ST.

I have found some Banks on Internet, mainly demos by known Wavestation
artists and sound creator.
Inside the demo-archives are "*.syx; *.mid; and *.lib files".

I just wanted some suggestions for nice *.syx Loader. I have already
found some.... they work and do not crash the Keyboard like PC
programs. (Resetting the Keyboard is hard work....)

Suggestions for other NICE *.syx loader still awaited! Or a better
method...? I have no idea.

Best regards,

Daniel Mandic

The SIL resistors will be pushed into SIL sockets, which *are* attached
to the motherboard. The sockets are black plastic, maybe 1/8" high &
1/8" wide. You should be able to pull the resistors out of the sockets
with your fingertips, you don't need pliers :-). Pull straight up to
avoid bending the pins if possible (but they're very forgiving, you can
almost always straighten the pins out afterwards with no problems).

If you ever need to re-insert them, there *is* a right & wrong way to
connect them, so make sure you make a note when you remove them as to
how they're marked (as noted above, there's usually a dot at the end
which is pin 1, and the motherboard will be silk-screened in some
fashion to indicate where pin 1 goes).

BTW, I'm a little puzzled that you can only see two terminating
resistors. Usually there are three, each with 8 pins. On the
motherboards that I'm familiar with, two are side by side and the third
is slightly offset, a short distance away. IIRC, the three resistor
sockets are silk-screened as RPA01, RPA02 & RPA03.

A last reminder: make sure your system is powered off and the power plug
is disconnected from the wall before doing *anything* inside your TT!

Good luck,
Roger

I don't want to sound biased, but overall I found the original
8-bit Apple II version had the most pleasing game play.

The Amiga and a recent PC remake (from Byte The Bullet)
were visually more colorful and graphically appealing, but from
what I recall the animation was awful. Almost in a comical way,
it reminded me of an animated Monty Phonty short, the way the
plane glides, turns and scrolls! The looped digitized clips were
less than stellar too. The Apple II one had a very realistic
flight-sim feel to it, combined with video game style action,
despite its MUCH more limited graphics and audio.

What is interesting is Broderbund had a 16-bit Apple IIGS
version being worked on by Matt Crysdale and Robin Kar
(programmer/artist dual behind PBI's Alien Mind) but it was

never released. Would've loved to have seen this.

Definitely one of my all time favorite games, I'll still pull
it out from time to time and play it on a real Apple II. :) Still
remember the cheat I discovered 20 years ago in the
Apple II version that allows you infinite lives. I think my
walk-thru is still floating around.

What cheat was that? My brother and I discovered how you could get 30 bombs, rockets or torpedos - made missions so much quicker ;) You'd highlight 'bombs' and then hit the up or down arrow key just when you hit the button on your joystick to choose that weapon. If you got the timing right, you'd end up with 30 rockets or torpedos. This also worked in reverse as well, so you could get only 1 rocket or 1 bomb, if you liked. ;) Just for fun, my brother did a whole mission with just 1 rocket at a time...took him a couple of hours. Another time, he did a mission with just rockets - even to take out the little soldiers running from the barracks or machine gun nests. He got quite good at sniping them from high altitudes.

hey thanks for that info Mitchell.

sounds to me that it's a similar story to Choplifter. Many, including the guy who wrote that game, Dan Gorlin, feel the Apple II version played the best. The Sega 8-bit arcade version had by far the nicest graphics, and this version was translated down to the Master System.

I too would have loved to have seen & played Wings of Fury on the 16-bit Apple IIGS. What a treat that would've been.

Like Rescue Raiders. If Wings of Fury is already redeveloped using
modern technology like 3-D graphic this century, it would be horrible slow
because of too much memory and depend on CPU / GPU speed heavily. I wish
that this century can reuse last century technology to continue using 8-bit
games this century!

On checking the schematic these are I think RAM pull ups. Looking closely at the photo it looks like the internal terminators have already been removed. The terminators on mine are right behind the external SCSI socket, which is of course where they should be. They fit into what looks at first like a 3 hole x 9 hole grid of sockets, but which is actually 3 x 9 hole sockets. In the photo you can just see the empty sockets between the external SCSI port and the square chip near the internal SCSI port. In this TT they are as Roger says slightly offset.

Of course this means that if you use the machine without any external SCSI you should pulg a terminator into the external SCSI port....

Source record: 5463

Hi,

The ATARI bookmarks page <http://eureka.atari.org/atari.html> was
updated. The goal consists in valid links, even if it corresponds
to sometime dated information. Part of those bookmarks persist since
the creation of the WEB page, 10 years ago.

The interest with these numerous bookmarks, there's 552, is to
constitute an ATARI uptodate and dedicated search engine of the
online scene. It is a service provided by Google Co-op. The base
of this engine is a collection composed from time to time. It has
become quite consistent now.

This is a first experience in the direction of WEB 2.0, because
even if I'm responsible of its creation, *ATARI Search Engine*
can possibly be extended by everybody connecting at

<http://www.google.com/coop/cse?cx=014753128619202207476%3Atzogojpdahi>

Have a good ATARI WEB Surfing :-)

# 1051. New version of SuJi

Newsgroup: comp.sys.atari.st
Date: 2007-05-13 18:13:39 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <yMWdnbF0NfHOyNrbRVnytgA@pipex.net>
Source record: 5465

Due to its flexibility, SuJi has long been the favourite file finder on the Atari range of computers running TOS, MagiC or MiNT. It will search for files matching an entered name or partial name (very extensive wild-cards can be used for search-masks); alternatively the contents of a directory, partition or whole disk can be listed. The results are displayed in a list which can be sorted in ascending or descending order on any of the columns (name, size, date, time, program flags, path of origin). If your desktop supports AV-Server, double-clicking an entry in the list will either launch the application if it is an executable file, or display the contents on the screen.

Now the original author, Daniel H�pfl, has released the sources, and Gerhard Stoll has used these to produce an improved version 1.36 that has three useful new features: Using Alt-O when the list is open brings up a dialog in which you can decide which columns are to be displayed (not many people will need to see the file time-stamp or the program flags, say), so making more room for long path-names to stay visible without scrolling the list window. In the same dialog you can also select which columns of selected entries (or the whole list) are to be written to the clipboard when you use Control-C; you can then paste this to a text editor for further processing. The third improvement is that both these options as well as the size and position of the list window are saved when the program is quit, so will come up the same way the next time you use SuJi.

SuJi remains freeware, is available in German, English or French, and may be downloaded from Gerhard's web page:
http://home.ewr-online.de/~gstoll/

This has been a public service announcement from Peter West (who produced and updated the English ST-Guide hypertext for it).

# 1052. Re: SIL terminating resistors on TT

Newsgroup: comp.sys.atari.st
Date: 2007-05-14 16:53:50 UTC
From: blah@blah.com
Message-ID: <rh4h43l5fhifnmsgmg5up4fameovlgvknn@4ax.com>
Source record: 5466

Hi Roger & David,

Thanks for your responses.

When I bought this TT it had an internal drive connected which worked
fine for a while. It plugged in ZIP drive and started having problems
with both the ZIP and also the HD.

Came back to the TT a few months later and the HD was not working at
all. I assumed it was duff and removed it hoping just to use the ZIP
as the HD. Now none of it works :o(

Right so if I'm understanding correctly this machine is "ready" as it
is for an external drive because the SIL resistors have been removed.
And if I get some resitors and plug them back in I could potentially
use both a ZIP and an internal HD.

Will any SCSI terminator do if it has the correct number/size pins?

Do TTs take IDE drives? I had another look at the HD I pulled and it
could be an IDE, there's no marking to either SCSI or IDE.

Cheers
Dave

news:rh4h43l5fhifnmsgmg5up4fameovlgvknn@4ax.com...
>
> Hi Roger & David,
>
> Thanks for your responses.
>

Lets start with a quick note on SCSI. Both the ends of a scsi cable "SHOULD"
be terminated. This can be done by terminating resistors on the last device,
or by a seperate terminator like this:-

http://www.worldofcables.com/oscatalog/CreateHTMLPagesItem/SCS-4910.htm
(fits on the external socket)

or like this

http://item.express.ebay.com/_W0QQitemZ120044580765QQcmdZExpressItem
(fits on the last socket on the cable)

Note that the TT SCSI controller sits between the internal hard drive and
the external connector. In a "basic" TT the internal drive provides the
termination at one end, and the "on board" terminating resistors provide the
termination at the other end.

> When I bought this TT it had an internal drive connected which worked
> fine for a while.

It "shouldn't" have worked with just an internal drive and without the
terminating resistors in place, or having an external container. However the
internal lead is very short and provided the internal drive had its
terminator resistors in place (generally older drives had these) or
termination enabled (later drives often have one link that enables the
terminator resistors) it would probably have worked.

> It plugged in ZIP drive and started having problems
> with both the ZIP and also the HD.
>

When you add the ZIP drive the cable length is probably long enough for the
electrical reflections caused by no termination to have an effect..Does the
zip have an "enable termination" link or resistor packs. Or was there some
kind of external terminator.

> Came back to the TT a few months later and the HD was not working at
> all. I assumed it was duff and removed it hoping just to use the ZIP
> as the HD. Now none of it works :o(

>

Sounds about right if the ZIP has no terminators.

> Right so if I'm understanding correctly this machine is "ready" as it
> is for an external drive because the SIL resistors have been removed.

It expects an external drive and an internal drive. The external drive need
to be terminated in this configuration.

> And if I get some resitors and plug them back in I could potentially
> use both a ZIP and an internal HD.

If you plug in terminators you should only use an internal drive.

>
> Will any SCSI terminator do if it has the correct number/size pins?
>

Some are designed for "differential". You need single ended.

> Do TTs take IDE drives? I had another look at the HD I pulled and it
> could be an IDE, there's no marking to either SCSI or IDE.

No, only Falcons take IDE (or othrs with IDE adaptor). If the drive has a
50pin or 68 pin connector its SCSI. If its 40 pin its IDE. Of course just to
muddy the waters there are devices like this:-

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=320113515428

# 1055. A DarkForce! BBS update (May 2007)

Newsgroup: comp.sys.atari.st
Date: 2007-05-16 18:51:50 UTC
From: "Ronald J. Hall" <darklord@suddenlink.net>
Message-ID: <pan.2007.05.16.18.51.50.489737@suddenlink.net>
Source record: 5469

First, apologies for being late this month, many, many
many things going on. An Atari SysOp is never bored. :)

Second, we've reached another milestone (of sorts) here,
at The DarkForce! BBS. We just recently added our 500th
user!

Because of that, I had to expand our user database. Some
functions, such as MassMail will have some unintended
consequences because of this. Current users will have
multiple old MassMail entries waiting for them. Simply
hit any key to go through them all. Everything should be
returned to normal on your next call. Thanks for your
patience and understanding in this matter.

So...here is to another 15 years and 500 more users! :)

Our monthly winner of the 3 magazine subscription to
ST Magazine is:

Orion_

Congratulations, and remember, you can't win if you don't
call each month! :D

Ok thanks for that. SCSI really does seemed to have changed quite a
bit over the years.

>Note that the TT SCSI controller sits between the internal hard drive and
>the external connector. In a "basic" TT the internal drive provides the
>termination at one end, and the "on board" terminating resistors provide the

Right got it, I think :o) Any idea where I can get some of these
terminating SIL resistors? Are the ones used in the TT still in
production?

>
>> When I bought this TT it had an internal drive connected which worked

I'm looking at the external drive now, it has what look like SIL
resitors near the SCSI port. They even look like they might pull out.
Going to leave this drive as it is because it has a load of registered
Atari software on it. I've put the pics on Yahoo photos again...

Yes the ZIP drive (and I tried two) has a switch to turn on/off. I
had it swet to On.

Ok best left alone then. The reason I favour using a ZIP drive as the
HD is because I'm going to have a blast at using MiNT when I have a
moment. Watch this space :-)

It's currently booting from an external ACSI Gastiener Mega Drive.
This thing is like a telephone book and sports a gargantuan 96mb...
Work though.

Sorry I should say BUS rather than cable. So on a TT with internal and
external drives you should have

terminator <=> Internal Drive <=> scsi controller <=> External Drive <=>
terminator

And of course the terminators may be inside the drives.

> >http://www.worldofcables.com/oscatalog/CreateHTMLPagesItem/SCS-4910.htm

To be honest I don't know what resistance they are, but I am sure compatible
ones are available.

Those are terminators. Leave them in if the drive is on the end of the
bus/chain.
If its in thye middle you must remove them. Why not pop this drive inside
the TT?

>

It should be OFF unless the drive is at the end of the physical chain.
Did you have both the ZIP and the Hard drive external and no internal?

# 1061. Re: SIL terminating resistors on TT

Newsgroup: comp.sys.atari.st
Date: 2007-05-17 09:57:03 UTC
From: David Wade <g8mqw@yahoo.com>
Message-ID: <N_idneCsu-Zsu9HbRVnygwA@eclipse.net.uk>
Source record: 5475

One other important note. When the TT boots its the device ID that
determines which device it boots from not the
position of the device in the chain. Each device must have a separate ID. If
you want to boot from a ZIP drive I think it needs to be ID0...

It can also have another ID, provided that there is no *bootable* device
with a lower ID. The Atari boots from the first device with a bootable
root sector, which is usually the device on which the hard disk driver
was installed.

FamilyNet International Newsgate

You know I think what did it for me was Star Raiders. They had that phrase where it mentions "186,000 miles per second for the speed of light. It's not a suggestionit's the law"

And so I've tried to hit light speed driving a car as often as possible. Hey it's the law right? >:)

# 1065. [ANN] Litchi beta 1

Newsgroup: comp.sys.atari.st
Date: 2007-05-17 19:43:09 UTC
From: Pierre TON-THAT <geek@atarians.com>
Message-ID: <464cb04d$0$21151$7a628cd7@news.club-internet.fr>
Source record: 5479

Bonsoir :)

Litchi is a next generation FTP client. Download on my website (after
the Troll) or directly in the folder http://rajah.atari.org/files/
-> litchib1_uk.zip (90KB)

Snapshot: http://rajah.atari.org/images/snapshots/litchi_snap.png

Still in development, but it's already usable (its archives were
uploaded with it). At the moment, the program is adapted to MagiC (and
MiNT ?). Working for old TOS is planned (8+3 names and intergrated local
files browser). Recusivity (folders and their contents) is also planned.

Hope you'll enjoy. Please read the ST-Guide doc for more informations.

Voilï¿½ !

While watching the video and seeing the "grandpas" in it, my thoughts was then: "damn, we are old!" I got my first ST at Christmas back in 1986 or 1987 . And i still have it, use it ( sometimes, i use more the Falcon or Aranym ) and love it. Since when do you use a computer? I mean, can you imagine the time between then and now? We grew up, we are married, have some children now ...

We got old!!! :o(

bye
Bernd

# 1068. Update for Thursday night IRC chat 8 PM CDT

Okay guys... as some of you may already know... Telnet is down. It
should be back up in a couple of days. But in the meantime... the java
applet is still available at www.newnet.net... although, some people
seem to be having problems with it. The best bet is use an IRC client.
I did discover a problem. Most of the servers won't let you in unless
you use port number 6667. So... if you are having problems connecting
to a NewNet server here is my suggestion. Type /server servername:6667
(ie: /server irc.eyearesee.org:6667)

Here is a list of the servers on New Net

irc.tobug.net
irc.Sith-Net.com
irc.rejectauthority.com
irc.redwolfs.net
irc.ircsoulz.org
irc.frog-face.com
irc.eyearesee.org
irc.spasticsystems.co.uk
irc.flatlined.net
irc.indianskickass.info

PeP a ï¿½crit :
> Screenshots looks pretty! Unfortunately, it crashes instantly on my
> machines (FreeMiNT/XaAES/68060, memory protection).

GFA program, it's said in the RTFM that this release is not compatible with MiNT memory protection: you should get the GFA source and compile it with a GFA library MiNT MP compliant, such as LicomLIB.

I should have compiled with this LicomLIB, but it has drawback i hate: the lib fragments memory with a remnant of small bytes when program exits. In multitasking, that's not really a backdraw, but it's really annoying under monoTOS, where you get less and less available RAM when you launch programs compiled with this lib.

Also, someone has reported a bug under MiNT (that is less visible under my MagiC system), "string too long" alert and quit. Maybe it's the big bug I have discovered in the 'sort by name' function.

I have implemented the local file browser window, so I plan to release the 'beta 2' this week-end. This is really convenient under monoTOS.

Voilï¿½.

Ah. I read the manual, but only the "installation and required things"-
section..

Thanks for releasing the source code! Good move! I'm a C-programmer
myself, but I'll set up LP:s GFA environment and see if I can get it
up and running.

regards

Great utility! Really usefull when looking for dependencies etc. while coding.

However - it seems to have some minor issues related to memory protection. Thing gets killed as soon as I launch SuJi... parhaps passing a bad pointer or something?

It's a Hades060, latest revisions of XaAES/FreeMiNT, Thing (latest
official version, not the beta), NVDI5.x.

> > parhaps passing a bad pointer or something?
> Is a bad pointer which is send by the AV protocol.

Yeah, that's my impression too.

I've also noticed that it doesn't find the AV server when double-
clicking on files in the "list of found files"-list, so it could be
something in the AV-related code. I've downloaded the sources and
browsed them briefly, but I'm using GCC myself so I can't really do
something unless I translate the source first.

# 1100. [ANN] Litchi beta 2

Newsgroup: comp.sys.atari.st
Date: 2007-05-26 19:36:34 UTC
From: Pierre TON-THAT <geek@atarians.com>
Message-ID: <46588c41$0$21144$7a628cd7@news.club-internet.fr>
Source record: 5414

Bonsoir :)

Upgrade of my new FTP client, download on my website (has changed location).
or directly with http://ptonthat.club.fr/files/litchib2_uk.zip (90B).

Carefull, I do not know if Club Internet likes direct download. It do
not permit to display the directory file list.

New snapshot: http://ptonthat.club.fr/images/snapshots/litchi_snap.png

New features in this release:
- fixed a bug in the 'sort by name' (that may cause a crash)
+ sort by type, distinguish case or not for sorting (Thanks _Dbug_)
+ some keyboard shortcuts
+ local files browser (convenient for monoTOS, Thanks Cooper for the idea)
+ Tidy windows
+ Download behaviors for each URL:
. point to download folder when opening connection
. verify free disk space before saving downloaded file
(careful, verifying slows the process)
. convert filenames to DOS 8+3 names (always done if not MagiC or MiNT)

In short words: adaptations for good old TOS.

Next release not next week, nor month, maybe in two months...
I would like to read Plato in the parc and appreciate the shiny sun.

Voilï¿½ !

Hello All,

I am back, but without my Hades. It is gone, at least that is what Fredi says. I now have a Falcon030 and am waiting for the CT60 with PCI upgrade from Czuba tech. I plan to put the Falcon motherboard in my old Hades case, so if there are any tips, I would like to hear them.

Until the CT60 comes, can anyone tell me why sometimes I have keep reseting the correct time and date on the Falcon when I quit a program. Other times I do not have to worry about like now. I even had to turn off the Falcon and it came back with the correct time and date?

It sounds like the onboard battery is going south, if not for turning it off/on and it coming back with the correct date/time. Mine acted just like yours, except for that.

I had Alex Yu at ATY Computers replace mine, with a socket, so I can change it out in the future (of course I'll be using my Falcon 5-10 years from now!). :)

Hello,

I can't remember the value of the fuse that protects the cartridge port
of the Falcon. I tried to read it on the one that is on my own, but I
can't believe 5A to be the correct value - I must have misread, don't I?
Someone here knows the type (F or T) and value ?
Thanks,

J.-Luc

Hi.

Quick question - I'm selling my Atari kit in the UK and wondered if advertising the ebay link was within policy for this group. Some groups like it, some groups don't and I don't want to annoy people.

Opinions? If no-one objects after a day or so, I'll post the link up.

Cheers,
Ian

I just looked at the schematics, and it just says Fuse F2. There is
other writing near the fuse symbol but I can't make it out as my copy
is incredibly bad. I thought it was supposed to be 0.5A.

I just checked the MegaSTe schematics, and indeed that one is written
as 0.5A.

imho, atari parts are rare enough to justify an ebay link. But the
auction should preserve the spirit of this group: high prices just to "make
money" should be avoided.

and the seller should keep in mind that he talks to a lot of specialists
when writing the description... no lies!

Guillaume.

Fully understood - I'm confident I don't fit into the "high prices just
'coz" category.

Well....-used- to be an expert quite a while ago. Hopefully my
knowledge can be brought back up to scratch.

Thanks,
Ian

# 1109. FA (UK): STe. SM124, hard drive, ethernet, Spectre GRC

<http://cgi.ebay.co.uk/Full-Atari-system-STe-mono-monitor-40Mb-HD-ethernet_W0QQitemZ140123132639QQihZ004QQcategoryZ4193QQssPageNameZWDVWQQrdZ1QQcmdZViewItem>

(God,

those ebay links are horrendous aren't they?)

Full system - highlights are STe, SM124 monitor, hard drive (40Mb'ish - don't actually know unformatted, but that's what the partitioned space added up to), Connect IT/Genius LAN ethernet adapter and Spectre GCR. Would like it to go to good home so thought it worth posting here.

(though that's -not- an invite for buy it now, to be honest I have no idea how much this bundle might go for so I'm happy to just let the auction sort it out).

Cheers,
Ian

Thought about that, but I tend not to like the fact you can't see where you're going, particularly relevant on Usenet in a group where I don't have much history (I -have- posted here before but not for years and never that regularly I'm afraid).

Cheers,
Ian

Yes the drive will work fine. I added one to a TT030 and also a GTS 100
external ST drive and it works great. (720k only though)

That never crossed my mind, I see your point. However, it's a commonly
accepted way to post a long link on a group, especially in news feeds,
because some news readers will never allow you to select a complete
URL thats split over two lines. It's worse when the original message
becomes quoted.

Anyway - here it is in tinyurl form. http://tinyurl.com/yqgm2v

## 1118. Hardware 286 PC emulator - what was the name?

Newsgroup: comp.sys.atari.st
Date: 2007-05-29 14:36:56 UTC
From: Ian McCall <ian@eruvia.org>
Message-ID: <5c2s47F2uchchU1@mid.individual.net>
Source record: 5432

I've been wracking my brains to remember this. When I had an Atari STFM, I had a hardware 286 emulator fitted inside it - 7.1Mhz I think, they later upgraded to 16Mhz. The resulting emulation was pretty good, though screen display was a bit slow. It was certainly good enough to get me through my 'A' levels (mostly Turbo Pascal) and the start of university too. Actually the ST made a superb machine for its time, since I could run it natively or emulate the PC and Mac as required.

Can anyone remember the name of it? It wasn't PC Ditto - that was software-only from memory. It was something else.

Cheers,
Ian

Wasn't PC-speed the XT version i.e. 8086 emulation?

I think AT Speed was the 286 version.

Also i think PC-ditto 2, hardware based this time was a 286 emulator.

Many depends from version of Mega STE. Earlier ones have TOS 2.05,
which has no HD floppy support.
There are some micro switches too, (see schenmatic) which must be set
for HD activation.

In any case upgrade to TOS 2.06 is worth, since 2.05 has too much bugs.

That's it - AT Speed. Excellent device, helped me through A levels (UK exams taken at 18 pre-university) whilst writing Turbo Pascal programs.

Thanks for that.

Cheers,
Ian

All but positive Ditto2 was an 8086 emulator. Gave up on it when realized it's color capabilities were CGA only. Still have it here somewhere. Never got along well with DOS3.3. Got somewhat competent with DOS5 after learning to type but by then had an AdSpeed and TEC Card on the CPU. Too bad they didn't get the Megabus connection finished.

At least I got to see it work. From what I understand most didn't. Even tried Windows V.2 on it. Obviously Windows V.2 was a loser on any computer but was unusable on this.

There is a little bit more than that. Ugrading my Mega STe required
changing a GAL, and adding a jumper on the bottom of the mother board.

B&C ComputerVisions, myatari2@juno.com, was most helpful with that
project.

Jim

Source record: 5444

Hi there!

I just installed Linux for the first time on one of my computers, and was struck by the fact that while our Atari's are struggling with using a very expensive program (NVDI) with way outdated drivers, Linux has really well done printer drivers available for it - for free and open source! I investigated a little, and got to thinking, why don't we have Foomatic, CUPS (Common Unix Printing System), and Gutenprint ported to Mint yet? Yeah, I'm sure the memory needs on them is a bit big for many Atari's, but then again, how many people with a complete Mint setup are running it on an ST? I would think most are using a TT, Hades, Milan, Afterburner, CT60, or Aranym for that task. From what I've read of them, they should be easily portable to any Unix system. I would think Mint falls under that category.

Does anyone know if it would be possible to incorporate CUPS and Gutenprint either into fVDI (if we want an NVDI-type configuration again) or into a stand-alone program (probably preferred)? If it were possible to accomplish, it would add greatly to the goal of having a completely free OS on the Atari, since that's one of the few common OS elements that's not currently free in any modern, usable fashion.

Just a thought. Comments?

Mike,

Sounds good to me! I'm running dual boot xp and linux on my x86 box,
and really am starting to like linux....just haven't settled on a distro
yet. I like PCLinixOS and Ubuntu. Would really like to see Mint get
heavily developed as linux does, along with synaptic type of way to
download software and....auto updates of system files as windows and
some linux distros do....ah....we can dream eh?

Another option that would require a lot less effort would be to use a PC
running Linux or Windows as a print server. The printer driver on the
Atari could print plain bitmaps to /dev/printer, the device driver will
then talk to the server on the PC which prints the bitmaps. NVDI is
already capable of "printing" to bitmap files, so you "only" need to
develop the server software.

Hi,

You may have a look at this TV show of a meeting between
Steve Jobs and Bill Gates in the US California, 30th of May.

<http://d5.allthingsd.com/20070530/video-steve-jobs-and-bill-gates-prologue/>

This show is composed of 7 part videos, a prologue and a "best
of jokes".

They are both remembering good old days beginning from 1977, and
30 years of "cordial" collaboration. It looks like "the nerd and the
visionary". I won't tell you who is who in my thoughts ;-)

Anyway, the word "ATARI" is pronounced apart from Apple and MS.

It's been very instructive for my knowledge of IT history.

You might learn from it ?

Best ATARIan regards,

Yeah, that would work, too, although not the idea I was shooting for. I was just trying to think/dream of possible alternatives should my NVDI-compatible printers completely die and I can't get anything compatible (that day is coming, you know, if not already here). Personally, I don't cherish the idea of having to fire up all of my computers just to print a document. I'd rather find some atari-based solution. Also, what about those of us, like myself, who don't have ethernet on their Atari's and have a Mac or other computer without a parallel port? I don't want to buy a PC (spit, ptoi! Hate those dumb things!) just to be able to print. If we could just buckle down and port something or write something that could use already ported and free drivers, I think it would be well worth it! Just my opinion.

Hi Michael and Nicole!

MANF>Also, what about those of us, like myself, who don't have ethernet
MANF>on their Atari's and have a Mac or other computer without a parallel
MANF>port?

You'd have to find a printer with parallel port still. While this is
still possible (e.g. Brother Laser Printers), I'd rather use such
printer over the network.

I've got a Falcon with Ethernet card, and a Brother MFC-7820N multi-
function laser printer attached to the network. It's locatad in
another room, so no way to use a parallel cable.

This printer knows both PostScript and PCL, and can be accessed
using both Samba and the older lpr.

How do I print to that printer from my Atari running MagiC and
MagiCNet? Or from MiNT+XaAES, for that matter?

MANF>If we could just buckle down and port something or write something
MANF>that could use already ported and free drivers, I think it would be
MANF>well worth it!

This should integrate seamlessly with NVDI, so one can simply print
via GDOS and the system cares for the rest.

With best regards
Ekkehard

# 1156. Internal Scsi connector in a TT

Newsgroup: comp.sys.atari.st
Date: 2007-06-04 20:30:08 UTC
From: fried.man@sympatico.ca
Message-ID: <1180989008.607161.6420@g4g2000hsf.googlegroups.com>
Source record: 5370

Hi there, this is probably going to seem a little dumb but here goes.
I would like to put a small HD in my TT, but I am not sure where the
internal 50 pin SCSI connector is.There is a small card, which seems
to have two 50 pin connectors attached, and is perpendicular to the
motherboard.
Any help is appreciated.
PS. I intend to sell this TT at some point.
Mark

Well, don't bother posting I found the connector, right next to the
floppy drive connector on the mother board, to the far right as you
face the back of the machine. The other thing I was looking at was the
VME connector for a graphics card I no longer have.
Thanks

## 1158. Centurbo problem

Newsgroup: comp.sys.atari.st
Date: 2007-06-04 22:44:16 UTC

Hi there, I have a Falcon with a Centurbo II fitted. It works pretty well, but I can't seem to save the flash parameters. When I set it to "external" hard disk driver and such things, it always reverts to "Cecile" and other settings. Also I can't seem to save the NVRAM settings, like for the desktop language for example. Is this a NVRAM problem or something to do with the Centurbo, or both?
Mark

The VME connector is just under the floppy unit.

Guillaume.

Source record: 5374

It's NVRAM problem, read this:

[NEW] KEEPTIME v1.0 System patch when battery of your Real Time Clock is down.

Friday, December 1st 2006,

KEEPTIME v1.0 is a patch to disable a system time reset when the battery of your RTC is dead. This text has been written for the Atari Falcon. It may be applied to Falcon, TT and compatibles.

---
The Problems
---

"My Falcon losts the time and date when I switch off."
( 15/31/07 0:00 for each boot )
"My Falcon boots in low resolution."
"My TOS is always in English and the keyboard is Qwerty."

---
The Explanation
---

Whenever you are shutting down your Falcon, the time,the date and NVRAM settings are saved into the RTC chip ( Real Time Clock ).
The Real Time Clock can also be named 'CMOS Clock' or 'CMOS Battery'.
The RTC contains a 128 bytes memory to save setup information.
The approximative life length of this chip is about 10-12 years because the RTC contains a built-in battery. The Falcon is not a very young machine, so the battery of your RTC is now dead !!

This chip soldered on the Falcon motherboard ( U64 ) is a Dallas DS1287. It can be replaced by unsoldering with the same chip or equivalent ( ST MK48T87B-24, MC146818A, MCCS146818BM ) . The Dallas DS1287 is, in fact, a DS1285 which a lithium battery has been included in the same block. So you can also break the shell of the RTC to find the built-in battery.
Then, you must disconnect the circuit of the battery and redirect it to a new external battery added. You can find infos about this process on Atari forums on the web or inside ST Magazine.( issue 141 )

Unfortunally, you don't want to open your Falcon and replace the RTC chip because you think you are not able to do this !

---
The Solution
---

First of all, a good solution is to launch the classic accessory Control Panel to set the time and date for each boot of the machine.

Yes, it's a safe solution but there is a problem !

If you are using TOS or MagiC operating systems, when you quit a program, a time and date reset occurs ! No problem, if you are using Mint OS.
I think it is a little bit irritating to work with that !

It is due to the specific XBIOS Function Gettime(). This same function can be found on TOS versions 3.xx ( TT ) and 4.xx ( Falcon ).

This function is called by the system when you return to desktop after closing an application.( I don't know why... )

The Gettime() function has a special behavior when it finds that the battery of the RTC is dead, this function simply resets the time and date!
The dead battery information is sent by the RTC itself.

KEEPTIME is a patch to disable in TOS the time reset by Gettime() function if the battery of your RTC is dead.

http://doyeuxyvan.free.fr/keeptime/v1.0/

You must run it in the AUTO folder.

Caution: To take effect, the TOS must be found in RAM !
Basically, the Falcon works with the TOS located in ROM.
Therefore, the TOS in ROM must be copied in RAM.

So you can use the excellent free tool by Uwe Seimet called ROMSPEED:
http://www.seimet.de/files/atari/romspd31.zip
http://doyeuxyvan.free.fr/keeptime/v1.0/romspd31/
You have just to run ROMSPEED.PRG in the AUTO folder before KEEPTIME.PRG.
In this case, you must know that the MMU is used by ROMSPEED to remap TOS in memory. KEEPTIME takes into account this functionality to locate the TOS.

Under MagiC operating system, the same function Gettime() as the TOS is present. However, you don't need to run ROMSPEED because MagiC is already loaded in RAM.

Copy in this order ROMSPEED.PRG and then KEEPTIME.PRG in your AUTO folder ( Generally C:\AUTO ). Be sure that your XCONTROL.ACC file is present in the root directory. ( Or any kind of another tool to set time and date )

"Thanks, time and date reset has been disabled as long as my Falcon is powered on, but I'm still booting in low resolution with wrong keyboard configuration..."

Yes, it remains the NVRAM configuration problem.
You can find different tools to set up keyboard, TOS language, etc.
But you can only reboot your Falcon if you want that parameters take effect.

I have selected NVRam by Centek:
http://centek.free.fr/atari/softs/nvram.zip
http://doyeuxyvan.free.fr/keeptime/v1.0/nvram/

With this tool you can, of course, configure the NVRAM ( into the RTC chip ). In addition, you can write a bootable program on a floppy disk which writes your selected configuration into NVRAM chip for every Falcon boot. Be sure that your floppy disk is present in the drive of course !

Follow this process to create a bootable floppy disk with NVRam:
- Run NVRAM.APP from the desktop.
- Set keyboard and TOS language, time format, boot resolution, ...
- Click on the floppy disk icon and insert a floppy disk in drive A.
- Click on the left icon ( NVRAM -> Floppy Disk ) in the new window opened. The program quickly writes the boot sector program on the disk with your NVRAM Settings.
- Then quit NVRam application. Your floppy disk is good.
( If you click on the NVRAM icon for quit, the settings are saved on NVRAM chip, but to take effect you must reboot. So, you can perform inifinte reboots with your good parameters until you switch off your Falcon. )

At each boot, NVRam bootable program looks for if it has been already installed in memory. In the case of NVRam already installed, the NVRAM config is not written.

So be careful when you have just switched off your Falcon, the memory and the RTC are not cleared instantly because it may remains residual current in the components. I advise to wait a long minute.

---
The End
---

Here is my summary procedure to work with a dead RTC battery:
- Switch on the Falcon with the correct floppy disk in drive.
- Very quickly, the floppy disk boot program will be read ( You can read on the screen NVRam flag ) and a system reset will occur.
- Now your Falcon boots with the correct NVRAM settings.
- After comes ROMSPEED and KEEPTIME loading.
- On the desktop, it remains to set the correct time and date in the Control Panel.
- That's all! Good Luck!

I just thought I'd let you know what I've been reading into the "Crusader" spam. I don't want to post this to usenet because somebody might try to tie that in to my posts in some way (someone already has, in uk.misc).

First of all, I'd like to ask you to believe that my phone line in my apartment is bugged, and has been for many months. I have moved a couple of times this year, but "they" have faithfully been on my trail.

Anyway, let's suppose my phone line is bugged. Now, when I talk to my internet service provider, it's over a SLIP (now PPP) connection. So if you wanted to bug what was said, either you'd listen in over the line and have to decode the transmission, or you could go to the service provider (more difficult) and ask them to decode a particular user's connection.

OK, so now they're listening to everything I do over my SLIP/PPP connection. A couple of months ago I was messing around with faking articles through nntp servers and through anonymous remailers. I chose a nice inconspicuous newsgroup for my little tests, something no-one would ever notice. Guess which newsgroup I chose??? Yes, _FISH_!!! or rec.aquaria to be precise

And guess what articles I tried to post? Goldfish, Koi carp and, you'll never guess... PIRANHA!!! The goldfish article and the Koi went through, but the piranha didn';t appear.

by now you probably think this is too silly for words. But if you look in the papers a few eeks ago you will find John Major, Tonny Blair and Paddy Ashdown sharing a "private joke" about Major's sunburnt goldfish. We haven't had anything about Koi yet (they must be too dull ). Now, sent by someone who clearly knew what they were doing (they chose an Italian backbone site for their launch point) we have many thousands of messages to people all over the globe. All about piranha, and with the punchline "that gives you something to think about, doesn't it?"

The way it works is that they're trying to kill two birds with one stone again. I don't knoiw why they should be against these national alliance people, but my interpretation is that they simultaneously try to discredit them, and stem the flow of Corley articles.

>corley" is. But at least we're observing a studied silence for now.

:People can always be called "MR X", to save them being named.
:
:I'm completely perplexed as to what you mean by b). Revealing identity?
:To who? And why would this be bad for any part of your life when you
:already have a less than respectful reputation here?

I'll just enumerate one or two things that I can still remember. Sometime
around August/Sept 1992 I was living in a house in Oxford, and coming out
of the house was physically attacked by someone - not punched, just grabbed
by the coat, with some verbals thrown in for good measure. That was something
the people at work shouldn't have known about... but soon after a couple of
people were talking right in front of me about, "yeah, I heard he was
attacked".

Again, one I went for a walk in some woods outside Oxford. The next day,
at work, someone said "you know he went to the forest yesterday".

I don't want to put details on usenet of what happened because to do so
would be to risk it happening again. If you put ideas in peoples' heads
then you can find them reflecting back at you, and I don't want that.
Also I can't remember that much from three years ago. From november 1992
I started taking "major tranquilizers" and just blotted the whole thing
from my mind.

>This is a feature time and time again, that the security services
>(presumed) get at you by manipulating other people around you to get at
>you. If you have their contacts, manpower, resources and technology then
>you can do that sort of thing.

:But why? Are you a threat?

They pretend they "have" to get at me. After the first few weeks they had
to find a reason to spy and abuse. You can't abuse someone unless they're
in the wrong in some way. What I did "wrong" was to be ill. So it became
"nutter" and "monster" and "he's going to attack us" coupled with
"ha ha ha, he can't do anything to defend himself, it was so funny". That
obvious contradiction within their propaganda is something they
blithely ignore.

:So, the Security Services never *actually* appear, and you assume that
:they get someone else to do your dirty work. This is a bit of a big
:logical step, here: That person doesn't like me, or is causing me trouble,
:it's not because they've got problems themselves, it must be the "Security
:Services". Yes. Because people are infallible. Or is there more?

A single source is indicated because of the range of harassment.
BBC + Capital + manipulated_public_at_large + set_up_situations,
what does that add up to? Add in the technology to carry out the
covert spying and the manpower and knowhow to follow you around for
five years without being spotted. It smells very much of the security
services, because there is no other organization (to my knowledge)
which does the things I've seen these people do.

Remember, they have deliberately chosen the softest of soft targets
to victimize. They purposely chose a mentally ill person who they thought
would be likely to kill himself anyway, so that they could get away with
murder.

And in all likelihood it will have started as a personal vendetta by someone.
Who could that be? I don't know, but I can give you some clues.

The first possibility (deep breath) is that someone from my college set me
up. Six years ago I graduated from university in the UK, during the last
year there I was steadily getting more and more ill. I know that I was
talking in my sleep; although I don't know what I was saying, it got
me a reputation, and if someone from my college talked afterwards to
the "wrong" people then that could be the reason for all that has followed.

I think that's the strongest contender for source. Directly beneath my
room lived another bloke who frequently had his friends round late at
night, after the time that I went to sleep. So they could have heard what
I was saying in my sleep, and that could have got me the reputation for
"talking to myself".

What I don't know is why that should have rebounded a year after I left.
You'd think it would have happened sooner; it's a bit odd to wait for a
year and then start abuse. That leads me to question what in particular
happened around May/June 1990 for them to start then.

>What I don't know is how it looks from the other side, from the side of
>the people who are being manipulated to get at me. On a couple of
>occasions I have challenged people to tell the truth of the matter, but
>they have alwats ducked the challenge.

:Have you ever considered the possibility, that you have made a mistake, and
:the people don't know what you are talking about?

Yes. I am currently considering the possibility that some people around me
know only what is being posted on Usenet, and have not been "contacted"
by "them". But I _know_ that others have been contacted.

:What words? Are they in common use? Could they be a catchphrase of a
:popular comedian?: "Nice to see you, to see you nice"?

In England the all-time No. 1 is "nutter". Easter this year, returning home from Clapham police station to report five years of harassment ("we're not saying it's happening and we're not saying it isn't happening"), another "not happening" incident of harassment when a cowardly little slut did her country proud by yelling "nutter, nutter, nutter" in the face of the hated enemy.

What can you do about that? You can't yell abuse back in their face, because they know they're supported by their peers, by the media, by the murderers in the security forces. You can't put them down when the fascist establishment is on their side. You can't hit them, because they would deny their abuse, they would deny knowing anything, and bring charges against the "nutter" who attacked them "at random".

>You know, you're
>passing saomeone, they're hardly going to construct an argument for your
>benefit, so they work a word of abuse into the conversation which they
>can giggle at.

:Abuse such as what? We're all adults here, we can take it. Is this abuse
:aimed at you? How can you tell it is?

I think I've said already what the words are. Thing is, at any given time the language is consistent. In January everyone's calling you X, then a few weeks later people stop calling you X and start calling you Y.

You can tell it's aimed at me, because when people repeatedly say the same words are you walk past, then laugh, you would have to be hard of understanding not to recognize it.

>Or they repeat something that's been said somewhere else... the PE thing
>being a case in point. PE says it, then other people pick up the refrain.

:Remind me who PE is again.

PE = "Private Eye"

>: >To give you an example, which I mentioned in another posting. In around
>: >October 1992, Private Eye ran a cover with the heading "Major's support
>: >lowest ever", with John calling to Norma on the cover "come back, Norma".
>: >Only one obvious interpretation to that, isn';;t there? I certainly
>: >thought so when I saw that cover. Wrongo!! Down the pub with people from work
>: >Simon says to phil, "don';t you think it's wrong then?" phil says, "well
>: >private eye are usuallyright"..."hislop strikes again..
>
>: Erm. Mike? Heeeellllllooo? What are you on about. What is the other
>: interpretation then? Norma having an affair? Seems a bit wrong, with the
>: heading "Majors support Lowest ever"...
>
>No, this one isn't obvious , it really does need to be explained. I
>certainly didn't understand it when I first saw it. You see, the kernel
>of vitriol is in the words "come back". At the time, the themes of
>abuse were centred around interpretations of those two words (stretch your
>mind a little bit, I don't have to spell it out for you, surely).

:You did in your mail item.
:
:You seem to be scouting about something called a "Double Entendre". The
:inference being "Come" = Ejaculation, "Back" = Anus (not the first part
:of the body I would have went for, I would have foolishly gone for "Back",
:silly old me).
:
:You see to have picked a sodomy double entendre out of a Private Eye
:headline. They are everywhere. The English language has much double
:meaning in it, and if you put your mind to it, you could pull a double
:entendre out of a randomly chosen page of the bible. So what?

>The point is that when Simon pointed it out to Phil, he did recognise
>what it meant after a moment's thought... and so did I... and so did the
>people who repeated it several times later... so however murky it may
>seem to you, that is the meaning they intended it to have...

I still don't really know if the meaning was intended when that headline was
written, or if it was simply "found" after the fact. The reason I think it
might be the former is that I got quite a lot of abuse along the lines of
"sound-alike" or "double-entendre" at work, in particularly from Steve.
So "double" inevitably came to mean split-personality, "two people in one";
"back" inevitably came to mean "backside", "come" inevitably meant you-know-
what, "split" (well, we'd better split now) again you can guess, "bent" (of
a similar bent), the list goes on forever. These aren't "nice" double-
entendres intended for comedy, they're nasty words to humiliate and cause
pain. If I could turn the clock back three years then I would sue my
former employers for harassment and I would almost certainly win. I had to
take pills after a year of Oxford, so they wouldn't be able to lie their
way out of it. Actually, I could still take them to court - the main
obstacle being that three years after the fact is a bit late and much
of what happened, the details that would be necessary for a case to go
to court, has just been obliterated by time.

Hi Snail

This person Corley seems quite interesting for three reasons. I put the
following at the end of a post in another thread just to see if he was

reading any other threads in uk.media.

It seems he is probably not.

---
Heres an interesting little story from back in the early days of CCD technology. There was this miniature camera which was designed to fit behind the infrared receiver lens of the remote control system (just beside the IR sensor itself) the camera clocked out the data in 256 lines of 256 pixels from a Fairchild chip and fed it out, a line at a time, into the VBI within the TV set itself. The signal could be picked up remotely from a standard license detector van from where it was stripped out of the surrounding RF signal and relayed back to the TV station where it was displayed as a slowscan monochrome image in a corner of the news readers monitor.

This is the first I'm an hearing about this. Can you guys give me more
details?

Is it after you log on with the new account?

Rob

I dont know the Mac+ at all but if it has a MC68000 then yes.

OK so the OS is faster but a modern PC is much faster then a Mac
Plus... I bet it could not play a 30 second MP3 file.

I'm running Windows 98SE on an AMD XP2600+ and it puts XP/Vista to shame.

"Load of rubbish, run Vista" they all say.

Comparatively speaking, today's computers are not hugely faster at all.
Almost all of the advancements are soaked up by a must-cater-for-all
bloatware O/S. In my mind; Windows98SE was the last one they got right.

None of this matters anyway as I code in RISC assembler for microcontrollers
with a whopping 128-bytes of RAM. They run off of a watch battery too.

The Atari ST today is still perfectly usable. If anything it's alot more
stable. Like, how often does your ST crash randomly?

Yes at a slightly slower clock speed.

Downside of the Atari was the OS was written in C which slowed down
execution a bit.

If you really want to get disappointed in modern MS OS, you can probably
check out some Dr. Dobb's Journal from the late 80s. One column that was
interesting was ~Inside Windows where they pointed out many flaws and
unscrupulous behavior by MS.

The rumor was the programmers at MS had the saying "Windows isn't done
until 123 won't run" in order to make excel the best selling
spreadsheet. Likewise they were in a battle to dominate word processing
software.

The net result was collusion between the OS and application programmers
at MS that eventually got them in trouble with the FTC. The OS
programmers would provide the application programmers with illegal
jump/locations in the OS so the applications would win benchmark tests.
If someone else used the illegal vectors, MS made sure the next version
of the OS would break their application.

You ended up with a bloated OS that had to carry forward illegal vectors
for their application compatibility and code to insure other
applications didn't run. That's a lot to ask an OS so you can't really
expect it to be fast or efficient too.

Hi Everyone.

I've moved the Falcon motherboard to a nice big tower case.

Everything is working fine but...I need some help on the Falcon motherboard.

Would someone be so kind as to write a step-by-step document on how to lead out all its connector, or point me to someone who could make the necessary cables and connectors?

I would most definitely be will to pay for the cables and connectors as my time is at a premium these days.

Thanks!

Hello,

There is a nice article on the MyAtari website and it mentions some places to buy the cables. I am planning on doing the same thing with my Falcon. My I ask was it a chore to get the motherboard into the tower? I was going to put my Falcon in my old Hades tower, but I think I may have to use another. The power supply looks like it will get in the way. Did you measure the dimensions of the MB? If so, can I have them?

What I did is found a place for the motherboard at the back of the
case. This way I only had to cut a hole on the case and use the
original connectors of the motherboard. Very cheap and some connectors
are hard to find.

In theory leading out a connector requires:
- find a connector that can be plugged to the motherboard connector
and wires can be soldered to it ( if the motherbord connector is MALE
the find the FEMAIL pair of it and vica versa)
- find a connector that looks like exactly like the connector on the
motherboard and wires can be soldered to it
- find a cable that has as many wires as many pins the connector has
- solder the two connectors to the cable: pin1 to pin1, pin2 to pint2
etc.
- use this method with all the connectors you want to lead out

Hi Rick!

Yeah really. Rembembering a desillusioned guy who tried to argument
with Lotus 123 in an AMIGA Shop.
PC was no thema at that time ;-)

MS can also stay conform to many things (e.g. Internet, Picture
formats, sound, video and other cross-platform thingies, IMHO).

Best regards,

Daniel Mandic

P.S.: Not again all that MS babbling (mainly ANTI, IMHO). Believe an
ol' AMIGA rant ;)!

I was under the impression NT was done by a different group at MS. It was meant to be server type<?> software so it didn't have the problems with having to make sure things like spread sheets wouldn't run.

I ran W2000 for years and only reason I stopped was HD crash. It is pretty good.
<snip>
> MS can also stay conform to many things (e.g. Internet, Picture
> formats, sound, video and other cross-platform thingies, IMHO).

*IF* you are really bored, take a look at QNX. Been a while since I last looked and I have heard one of the key programmers died.

For a while they had a down load of a 1.4 meg floppy image that would boot on a Intel platform and IIRC provice web browser and GUI.

Super stable, used in critical operations like oil wells. Small foot print so it can be used in embedded systems.

I am a Digital Research fan too of course. I even used DR DOS 6 so I could have an ST format GUI on my IBM compatible while waiting 15 years for MS to come up with a stable OS.

I'm ok with XP but just the other day I used CCleaner on my S.O.'s computer. It recovered something like 350 megs of disk space. When I ran a registry cleaner on my computer it came up with ~900 bad entries.

This leads me to believe XP in reality isn't very good. It is just that todays 10-100 giga byte drives hide just how bad it is.

Hi Rick!

Stolen?

No, joke aside :-), they paid for it. The prehistoric NT Kernel is
still tough and newer NT's rely, AFAIK, on that old one, not really
developed by MS itself.

> I am a Digital Research fan too of course. I even used DR DOS 6 so I
> could have an ST format GUI on my IBM compatible while waiting 15
> years for MS to come up with a stable OS.

Yes, that's right. NT was with version 3 already a Hammer, but I can
good remember the Hardware available at that times. My DOS have had
32MB (iDX4-100, Saturn-II PCI/ISA), which was far more than std.
shop-PC's with 4MB and
Pentiums with Slooooow boards (Chipsets). ~93/93
But that 32MB costed ~1400bucks then, and NT3.x could just start/boot
with 32MB ;-) etc. AMIGA OS3.x was still the better choice for me and my
computing.

<=4MB Fast-RAM, and every communications is going well. DOS and
Internet was no thematic for me, and Windows??... errrrrrrmmm.
:-) not till NT4 came out... (it's still dazzling. Well, the USB Mouse,
now 15y too late is nice [NT<=5]. The AMIGA Mouse-cursor is still
smoother ;-))

But I heard that Bill Gates was interested, long ago: "How's that Mouse
cursor operating?" (when he saw the first window operated OS, I think
it was a Apple!?). He never met the smoothness of AMIGA, or better said
ATARI.
Apple is not in the slightest my case. I would rather fortify my next
five years to learn Linux/unix, before I would use on a Mac. Brrrrr.

> I'm ok with XP but just the other day I used CCleaner on my S.O.'s
> computer. It recovered something like 350 megs of disk space. When I

Today it's easier with CPU's over 500MHz. Well...

> This leads me to believe XP in reality isn't very good. It is just
> that todays 10-100 giga byte drives hide just how bad it is.

XP=Experience ;-)

It looks too much candy at the first but can be configured nicely to
lower NT outlook. I was almost satisfied with Nt4 for computing
(Internet), but XP is much better and free of Military certifications :)

I can't say much bad, but I am wondering about the stability, indeed.

Kind regards,

Daniel Mandic

Hello all,

I registered yesterday late (10.00/11.00 pm), but didn't get
my password so far.
I just wonder if this site isn't just a fake, reproducing
actual pages just for grabbing personal e-mails...

Edward,

What I did was remove my falcon's mb from it's original case, then trace around it on a poster board, then marked where all the screw holes of the mb were onto the poster board. I then cut out the poster board and voila!..I had a template of the falcon's mb which I then placed into my very big tower case. After fidgeting about, I was able to mark where the mb standoffs should be placed...mounted the mb...and that was it!

The difficult part...for me that is... are the lead outs of all the connectors.

Heck, I'm even nervous about soldering the 2 wires of the ctcm to the ct60!!!

I hope this helps! My tower case stands just over 27" tall and 17" deep...and that's not including the wheels! :) :)

Hello again,

Just tried again :

- registering with same account and my e-mail, states the account
is already used, and to try another with one,
- logging with the so-stated existing account, states that cookies
must be enabled past this point - but they are on the windows
machine I used for this purpose!
- going to the forums pages and asking a new password, states the
e-mail adress can't be found - what did they smoke or drink ?
- going to the map module and creating my location, said I don't
have authorization to access the module!

Really, what for a shambles is this ??????????????????????????

I can't say exactly what is the problem with atari-users website but I have a few thoughts here.

> - registering with same account and my e-mail, states the account
> is already used, and to try another with one

I've often found that if an account is already created on a forum/ portal (even if not yet active!) it is (of course!) not possible to create another one with the same email address. After all, the email address is used as the identifying "handle", so to speak.

> - going to the forums pages and asking a new password, states the
> e-mail adress can't be found - what did they smoke or drink ?

Appearantly the AUN server can't send back new passwords to a not yet active account. I don't think the web servers drinking or smoking habits is an issue here.

> - going to the map module and creating my location, said I don't
> have authorization to access the module!

It seems like the map module requires users to log in to create their map location. But if your account is not active, then you can't log in. Quite logical, actually.

Obviously atari-users.net has a problem with the sign up process, maybe something todo with the verification email not being sent from the server. I am sure Rob will do what he can to sort this out though.

Regards,

/Joakim

WHAT?? I've had a few beers.. so forgive the rudeness.. are you an
idiot???? WHY with all the ATARI sites I host would I be collecting
'personal e-mails' ????? Fake site???????

Just to point out .. this same server host Highwire, AtarICQ and the
SpareMiNT (and CVS) sites. Not to mention the other Atari sites I host
and run myself.

> Ice - its obviously very good, but its just a bit too cute for my taste. :)

Yeah, I wasn't a big fan of the digitised screams on the Amiga
version. Also the flight controls felt a little off somehow. Too
colourful too. hehe.. I'd grown used to the stark colour of the c64
version. Sorry, haven't seen the Apple II version. For me it was
definitely the c64 version that was best. I expect the Apple II
version probably had a similarly good feel to the flight controls.
(It did feel very sim-ish.) I would somehow seem right on a green
phosphor screen too. (I'm very much a retrogamer at heart .. I like
my Apple II games to be played on a green phosphor screen.)

It was one of those games I preferred having infinite missiles/bombs
for. Too much to-and-fro-ing with the regular ordinance quota. The
game was quite time consuming enough as it was. :)

I would agree too that the Apple II version of Choplifter was the
best. Though I was over the moon to see it get the arcade treatment,
but they somehow lost some of the fun factor in that version. The c64
version was very good, but I think the Apple wins out because of the
analogue stick and two buttons - made the game much more playable.
Other than that the c64 and Apple versions play almost identically.
Nice raster-effect in the border of the c64 one too .. made the game
feel almost full-screen.

Nathan.

Not on the Windows machine I used for this.
And, even on my FalCT60, I control each message marked as spam
before retrieving the mails.

Seems the bubbles of the beers are sparkling... ;-)
OK, what I exactly meant was : would it be possible that part of this
site would be hooked (is that the exact term?) by someone, who could
have used it for bad purpose ?
Well, I thing that "pirated" could be the correct term.
>
> Just to point out .. this same server host Highwire, AtarICQ and the

And, of course, thinking the own maintainer of the site being the
author of the "piracy" is a non-sense.

Well, let's sum-up : I registered to this site, with my regular
e-mail adress, and got a message stating that I would receive my
password soon. That was two days ago.
As of today, I didn't receive any password - and, no, I don't use
any spam filter on the windows machine, and even on my FalCT60 I
check every mail checked as spam and uncheck it if necessary before
retrieving my mails -, and the account I created is not active
though acknowledged.
I think the correct term for this is "deadlock", isn't it ?
So, let's see what happens next.

Thanks, but that's not what I need. I've already put my falcon in a
tall tower case. I just need someone to write a step-by-step document
on how to lead out all its connector, or point me to someone who could
make the necessary cables and connectors.

I would most definitely be will to pay someone to make the cables and
connectors, provided the price is fair.

Erm, am I misunderstanding something here? Did you click all the links
on the top of the page? There Joakim describes how to make extensions
for cables etc.

The only cable extension it described, which I was interested in, was
the vga extension.

I also need that info, or the actual cables themselves, for all the
other ports except midi.

Thanks

Why not just make your own cables? The only one that will be tricky is the SCSI from what I recall of the Falcon. The D-subs can be done with IDC plugs and sockets and ribbon cable, and a vice to clamp the connectors up.

I actually re-housed my falcon in an ugly rack mount case, thinking im
gonna 'need' CD writer, large hard drive, big PSU, CT60 etc etc
etc....

Very soon it's all going back in the original case, I have the micro
PSU, plenty of CF cards plus an IDE adapter, and so I can ditch the
3.5" HD and CD writer (used ONCE!). I think these days most people
don't need to go full tower form factor, as everything you could need
is so much smaller.

I just gotta buy HDDriver cos its the only thing that will work with
CF cards. I think.

If I had the time, I would do it myself. However, I am extremely busy and have very little time...I haven't even had time to organize my home office in order to work on my falcon. That's why I'm particulary interested in someone to make the cables for me...for which I'd be willing to pay.

Thanks

# 1228. Stacey 4 Power Supply

Newsgroup: comp.sys.atari.st
Date: 2007-06-14 00:27:50 UTC
From: Emil <emiliocris2@yahoo.com>

Source record: 5342

Hi All,

I just got a Stacey 4 without a power supply and battery pack. The
power supply is 18v 2a.

1) Does anyone have an idea where I can get the right adapter/charger?
Radio Shack does not have one that syncs to 18V 2A.

2) I am unable to get power with other adapters. Is this okay?

3) Does the Stacey4 have a fuse somewhere?

The laptop is very clean and looks like it has not been tampered or
opened.

Thanks.

Take my advice and don't touch it until you can devote time to do it
properly. It won't be a five-minute job anyway, and inevitably you will
have to bug fix afterwards.

I've got 2 cables that might help you.
They are both the same, about 13cm long, with a 9 pin D type plug one
end and black plastic socket (10 holes, 2 rows of 5) at the other, that
plugs into a cct board. If that doesn't make sense I'll upload a pic.
Cheers
Jammer

You can find "universal" powersupplies for laptops, like this one:

http://www.amazon.fr/Targus-Notebook-Adaptateur-secteur-externe/dp/B000JJGRCW

(some cheaper alternatives can be found, be sure to take one that claims to
be a switcing mode PSU)

>2) I am unable to get power with other adapters. Is this okay?

It all depends on those other adapters characteristics ...

You shouldn't need to have a 18V 2A replacement PSU. Another PSU with the
same voltage and superior intensity (more than 2 Amps) should do it.

Look around eBay, but be wary of old supplies. 18VDC 2A is not that common, and some older supplies can drift off of specification after enough years. Alternatively, you can use a battery (the Stacy will actually accept anything from 10.6 to 18V and converts it internally to 12V). See below for more details.

> 2) I am unable to get power with other adapters. Is this okay?

If your adapter is under 2A the STacy probably won't start. It has a significant startup drain.

> 3) Does the Stacey4 have a fuse somewhere?

I think so, but no longer remember for sure. It's been six years since I owned one.

The STacy expects an input between 10.6 and 18VDC. (The STacy has a 'power low' light
that comes on around 11.5V. However, the STacy keeps running until somewhere around 10.5V).

I experimented with the STacy in 2001 and made several posts in 2002 regarding powering the STacy with batteries. Here's a brief summary:

Don't use "C" cells! Atari and I both tried it, and it doesn't work well (you get 15 minutes per charge). With some expensive high-amperage cells you can get 30 minutes, but internal packs just don't have enough juice!

However, a 12V cord to a 12V battery will work, but since the "power low" light comes on at 11.5V you will have the "power low" light on frequently. Also, you need to have a large enough battery to handle the drain. Expect to use 2 - 3 Ah (Amp-Hours) of capacity for each hour of use for large (auto-sized) batteries and 3 - 4 Ah of capacity for smaller batteries due to the voltage drop. The commonly available "jumpstart" batteries typically hold 14 - 21 Ah and thus I'd suspect that they'd work for several hours. (FWIW, I used a 40 pound 72 Ah lead-acid wheelchair battery (13.8V) to power the STacy for several years and managed over 24 hours a charge!)

Before I go, let me note that I'm going off of memory, although I'm reasonably certain my numbers are accurate. Still, no warranties are given or implied.

Galen

Hello Sam,
I am very curious about this card as well. I have not heard anything
from the developer. I even put myself down as a possible tester when a
workable prototype was available. Been so long I might have to write
the guy agian and see what is up. I thought OzK was one of them working
on the software end of it. Might have just been the drivers not sure.
Agian been a long while. Hope we hear some good news

Thanks,

Bonsoir :)

Download on my homepage or directly in the folder
http://rajah.atari.org/files/ -> litchib3_uk.zip (100KB)

snapshot: http://rajah.atari.org/images/snapshots/litchi_snap.png

News: console and statistic (please activate them in the options config.
disabled by default coz it costs CPU time on ST 8 MHz).

News in details:
- internal database numbers, unsused are removed (listing will be quicker)
- RSC adaptations for 640*200 screen rezolution
- if 8+3 filename convertion and if filename already present, the dialog
will always appear.
+ warning alert if using accent or space on foldername or filename
(FTP protocole do not manage those, it's dangerous to use them)
+ console (disabled by default, activate it in the options), choice to
display errors, warnings, informations, FTP protocole
+ data flow and estimated remaining time computing (disabled by default,
activate it in the options, doing this maths may slow data transfers)
+ LITCHI.BUB file for helping bubbles (carefull, in the BUBBLGEM.CPX,
check 'top only' if you have checked 'help deamon', to avoid nasty
blocking by bubble during files transfers)
+ new dieHardUser behavior: if 'Control' key is pressed at start of a
drag&drop files (local to remote, remote to local windows only),
then the files will be MOVED instead of COPIED.
(deletion at the source, if transfer was correct)

Hope you'll appreciate.
Next step is recursivity (transfer of folders contents), but i dont
know if i will be able to code it.

Voilï¿½ !

Hello,

Yes this does help. That is bascially what the article said to do. I have only one question, where is the power supply in your tower? The one in my old Hades case is too low and i cannot move it up unless I cut through the back of the tower. When I get my CT63, I am going to install it without soldering as my skills there are very bad. Thanks for the information.

>Edward,

Hello Coda,

The Micro PSU could be another option for me. It is powerful enough to use on the Falcon and a whole bunch of extras like a Jaz drive, 3.5" drive and two CD drives? I will have to look into that, but everything is at stand still until I get the CT63.

Actually I bought a VGA adapter for the Falcon that is about 5 inches long. It should work for me. I bought it on Ebay. I bought two and the other one was shorter, about one inch.

I didn't recased my Falcon but i've recased my old ST. I took the old case, cut it with a saw, closed it with parts what i have left over and solderd a connector by myself. BTW: Nice feature was the power and the reset switch at the keyboard. :)

bye from germany
Bernd.

I used a modular socket, the kind that you get in a DB25<=>RJ45 plug.
I wired this to the Falcon and then this allows me to use a MegaSTE/TT
keyboard.

I purchased a keyboard adapter, allowing my to use a MegaST keyboard for
my Falcon. I really didn't want to go the route of using a regular pc
keyboard.

Edward, I feel exactly the same way....I'm even worried about soldering
the two wire which go from the CTCM to the CT060!! That's about all the
soldering that I'll attempt.
Furthermore, I would rather have the lead out plug in to the Falcon
ports, and the other ends attach to brackets and those get screwed in to
the backplane of the tower, the same way as pc boxes do.

The only pascal I saw was the Pure Pascal, long time ago!
It's a very old one, 20 years ago it could look as a serious development
system, but now, it's obsolete.
The editor used to reserve 80 bytes for each line, whatever was typed
in. So this limited the size of the edited program!

But, if anyone else has "newer news"...

Guillaume.

# 1262. Screenshots: égale, Tetric, X-Point

Newsgroup: comp.sys.atari.st

Source record: 5276

Hi,

in the nineties, I was the author and maintainer of a couple of programs for the Atari (TOS), and I'd quite like to have a couple of screenshots of these programs. Unfortunately, I don't have the original source code any longer, nor do I have the right hardware setup to run all of them. Are there any enthusiasts willing to help?

The programs are

égale - a tool to compare and edit files. This runs on later TOS systems (such as MagiC) as well. Developed 1993-98.

Tetric - a Tetris clone for b/w (640x400) with my extra cheesy background music and multi-player option via MIDI network or modem connection. Published in 1992.

X-Point - a news&e-mail client for a small network of BBSes, Starnet, which was based in Germany.

ClickRun - a graphical shell that allowed users to quickly access programs and files. A bit like today's OS X "Dock".

I've managed to run NoSTalgia, which is neat, but if any of you here have screenshots (color, b/w, anything will do), please drop me a line (by direct e-mail).

Thanks
David

I used to program quite a bit in Pascal at university. At that time I only
had my Falcon and did a lot of programming using High Speed Pascal. This
is a fairly good Turbo Pascal clone, it even has BGI libraries. It also
has GEM and AES libraries, so you can develop GEM applications if you
want. Unline Pure Pascal (which I don't have any experience with) it
doesn't support the OO extensions in later versions of Turbo Pascal.

I would say, forget Pascal. It was designed as a tool to teach programming, hence the reason why it is (or was) so present in schools and uni's. Of course there were some great app's written in Pascal, just as in any language, but you are much better off learning C. That's of course if you really don't want to stick with GFA, which is actually a quite flexible and powerful language.

If you want to program C on the Atari, I think there are these choices today:

1. Hisoft C. Interpreted C, but compiler is available. Obsolete, and no support anywhere, AFAIK. I don't know anyone using this today.
2. Lattice C. (Also by hisoft). Professional and almost complete C compiler with some C++ syntax. Obsolete, no support, but fairly comprehensive manuals. Some Atari programmers still use it (me included) so answers to tricky problems can still be found (the archive of the CSASP newsgroup is useful). Can sometimes be found for sale on ebay, and some Atari vendors may still sell it.
3. Pure C. Unless you speak German, there is no documentation, apart from a small English introduction and basic usage guide. Quite a few Atari programmers still use Pure C though. I think HDDriver is written in Pure C. There are good libraries available for Pure C (Godlib springs to mind).
4. Gnu C/C++. You need a MiNT installation to use this, and some knowledge of how to work in a Unix environment. Quite a few developers use this package, a lot of dev is done with GNU C, not only on Atari, but also on every unix platform in the world, and others (its even available for windows, but the unix version can still build windows binaries!). If you want future compatibility, or to port code from other platforms this is the one to go for. Atari libraries are available.

Good luck.

Hi,

You can have a look at "Alice Pascal" from its author page

<http://www.templetons.com/brad/alice.html>

I guess it is a good entry point in that matter :-)

Best regards,

>Can you send me your complete develop environment as zip file?

Sure, I put it on my page:
http://perso.orange.fr/gtello/gnu_tos.zip

7 Mb...

It's the copy of the folder that was located on disk N:, so
N:\GCC\etc... You may have to change some paths.
The shell itself is:
N:\GCC\TOOLS\GCCSHELL\GCCSHELL.APP

Depending on your video system, you'll have to update (or not) the
SCREEN.LDG (the same as the one used with MyAES).

It's been some months since I used it for the last time, I'll try to
help if I can, or I'll redirect your questions to Olivier if I can't answer
myself.

Guillaume.

# 1272. My Vintage Computing Files Archive

Newsgroup: comp.sys.atari.st
Date: 2007-06-21 04:18:03 UTC
From: hexstar <hexstar@gmail.com>
Message-ID: <1182399483.697494.241730@a26g2000pre.googlegroups.com>
Source record: 5286
Cross-posted to: comp.sys.apple2,comp.sys.atari.st,bit.listserv.coco,comp.sys.ti,comp.sys.ibm.pc.classic

It is my belief that archives like this one should be provided without any limitation to the end users ability to utilize the archive. These archives are getting harder and harder to find and because of that we all should do what we can to let those who want to mirror our archives do so. As such I am now bringing this archive to the vintage computing community. I have not and will not put any limitations on how users can utilize the archive provided here. Users can freely download as much or as little of the archive as they want. Users can also freely contribute as much or as little to the archive as they want. This way people will be able to mirror the archive easily which will help ensure the files contained in this archive have a nice long life span. This will also allow this archive to grow freely and become an ever increasingly useful resource to fellow vintage computing hobbyists. It is my hope that people will take advantage of the great disk space and bandwidth provided here and both contribute to and download from this archive. This will allow users to have a good solid place to go whenever they are in need of a file for their vintage computing hobby. With the resources provided here it is my hope that with others contributions and utilization of this archive that this will become a great resource for all vintage computer hobbyists. That's right, there is no certain vintage computing era this archive is limited to (except the 2000+ computers and their related files), as it is my hope that this becomes a great central archive of everything vintage computing. A resource that makes the vintage computing hobby easier and less intimidating by not requiring hobbyists to go all over the internet for the files they need. Hopefully someday this goal will be met for the benefit of everyone who enjoys vintage computing as a hobby. Enjoy! :-)

FAQ

Where are the files?

The files are hosted on a KDX server. This provides me with an easy to administrate server and it provides everyone else with a nice, easy to navigate, server with which you can download/upload files and chat. If you don't know what KDX is click here for details on what KDX is and how to use it as well as download links for the client. To connect simply use kdxvcfa.dyndns.ws as the address, a username/password is not necessary.

What about http/ftp access?

You can still access the archive via http by clicking here, however note that the http copy of the archive will no longer be updated.

Instead it is highly recommended that you use KDX to enjoy the latest additions to the archive. The same goes for ftp uploading, please upload via the Uploads folder in KDX instead as the archive will now continue to be maintained only via KDX.

Why the change to KDX?
Http access was great for a while. However, http access was being donated and as such disk space was limited. The donated disk space is now getting tight and as such I had to think of alternative methods of keeping the archive online. The best way I could think of was to host the archive myself since I have a bunch of HD's here which thus provide plenty of disk space for the continued expansion of this archive. I could easily have setup http access myself but I thought that since I was doing the hosting myself I might as well use KDX. Why? It's easier to administrate, the administration interface provides many easy to utilize controls for what users can and can't do. It has everything for the makings of a community, file browsing for downloading/uploading, a chat room, private messaging support, and a news section. In addition KDX is completely free and has clients for all the best operating systems: Linux, Mac OS, and Windows so no matter what OS you use you can still enjoy this archive. So now the archive is being provided and maintained via KDX.

How can I contribute to the archive?

To contribute to the archive simply upload your files in the Uploads folder

To expedite the sorting of uploads please do the following when uploading files to the archive:

* Look for a folder corresponding to the type of computer your files are related to (Apple, DEC, Commodore, etc)

* If one exists go in it and place it in the correct category sub folder (e.g. Utilities, Multimedia, Office, etc)

* If the folder corresponding to the type of computer your files are related to doesn't exist or the correct category subfolder doesn't exist create it and place your files inside of the folder (if you create a category subfolder for a category that doesn't exist publicly and your files are determined to be able to be legally hostable, the new category will be created publicly with your files inside of the new category)

This will help speed up the sorting of the uploads by avoiding mess and clutter as much as possible. Thanks! :-)

Uploaded files are not instantly made publicly available as it is necessary to review the files for possible legal issues which could prevent them from being able to be shared publicly on the server, the upload folder is checked daily and any newly uploaded content that is deemed legally sharable (e.g. abandonware and/or software which was

made by a company that no longer exists or still exists but has long since abandoned the software and does not care if the software is shared) will be sorted in the appropriate publicly accessible folders.

What era or type of vintage computer related files are allowed in this archive?

There is no specific era or vintage computer that this archive is restricted to as long as the file(s) don't relate to any computer made in 2000+. It is my hope that this becomes a great central archive of everything vintage computing. A resource that makes the vintage computing hobby easier and less intimidating by not requiring hobbyists to go all over the internet for the files they need. Hopefully someday this goal will be met for the benefit of everyone who enjoys vintage computing as a hobby.

Why should I contribute to/download from this archive?

This archive is unique in that it is maintained with the belief that there should be no limitations in place for how one can utilize this archive. This archive is hosted on a server with 200GB of disk space and 2.8TB of monthly bandwidth, this ensures that everyone can enjoy the archive equally. In addition this archive is hosted in a state of the art data center in the USA, this means that the server has high upload and download speeds, something not every vintage computing archive has unfortunately. The high bandwidth and disk space available for everyone's use ensures that everyone can equally enjoy this archive with nice fast speeds both up and down. This in turn makes it easy for people to download the files they need and for people to contribute to this archive without spending a lot of time doing either. In addition every file uploaded is backed up locally so that if the hard drive in the server goes bad the files will not be gone and can easily be reuploaded (and they would be as soon as the hard drive got replaced). Not only that but because I encourage people to mirror this archive you can rest assured that I will not be the only person with a backup of this archive so that these files will have a good, long life span.

Do you backup the archive?

Yes I sure do. Every time I check for new uploads I backup the uploaded content locally onto two hard drives.

Can I download the entire archive?

Yes! You certainly can using something like wget. I do not believe in limiting the potential of these types of archives as explained above and as such there is nothing stopping you from downloading the entire archive. In fact I encourage people to mirror this archive as it'll help ensure that the files stay around longer. Also note that while we won't stop people from downloading the whole archive for their own personal use ( i.e. they have no intention of later sharing the archive with others) it is preferred instead that in this case files

are downloaded individually as needed.

What can I do if I find one or more files that are wrongly categorized?

Please email me at hexstar@gmail.com with the location of the file(s) in question and the location where you believe they should be moved to.

How can I contact you?

You can contact me at hexstar@gmail.com

That soundsok to me. I have the DEKA hardware from Wiztronics. I plan to use that, but if things bad your solution is a good one. I like the TT and Mega keyboards.

One more, how about the reset and hard drive light connections. My tower has those, can Ijust connect them to the Falcon motherboard or is there some modifications involved?

Yes I want the ports to be screwed in the back of the tower also. I am still
checking for someone to do this for me. There may be someone locally who can
do this, but I have sent some emails out.

# 1278. Atari MEGA STE floppy drive power cable

Newsgroup: comp.sys.atari.st
Date: 2007-06-21 08:47:32 UTC
From: Ryan <no@spam.invalid>
Message-ID: <no-8199EB.03473121062007@johnf2.biosci.ohio-state.edu>
Source record: 5287

Hi everyone. I posted this question to this newsgroup 6 months ago and didn't get a good response, and then I forgot about the Atari for awhile, but now I'm getting back into it -- just got a synthesizer again and would like to read my songs off my floppies. So I'd appreciate some help from a fellow MEGA STE owner.

I disconnected the floppy drive's power cable, without realizing that it would physically reconnect to the drive in either orientation. Now I want to plug it back in but don't want to fry the drive by plugging it in wrong. So the question is: which way should it be plugged in?

http://ryandesign.com/tmp/atari-mega-ste-floppy-drive-power-cable.jpg

Thanks in advance for anyone who can set me straight on this!

# 1279. ADOPTION: PORTLAND, OREGON USA!

> a little reference and guidence needed

Back in 1986 or 1987, I bought Personal Pascal from OSS for my Atari 520ST and made heavy use of it for several years. At the time I found it quite adequate, but I'm not sure how it stacks up today against other Pascal compilers for the ST. One oddity about it is that it includes GEM interfaces, but it modified and simplified the standard GEM interfaces. Thus, if you learn GEM programming via Personal Pascal, you'll have to re-learn it if you subsequently change to another language. Personal Pascal's GEM interfaces are odd in that they let you build dialog boxes, menus, etc., without using a resource editor, which is a requirement of most other ST languages. If you've got a separate resource editor, you can still use it; but if not you'll have to code dialog boxes, etc., by hand in the main program.

For learning Pascal generally (particularly an older one like Personal Pascal), I can heartily recommend the book _Oh! Pascal!, 2nd Edition_ (1985) by Doug Cooper and Michael Clancy (ISBN 0-393-95445-5). Checking Amazon.com, it seems that the book is long out of print and hasn't been updated in a while, but it's extremely well-written. Amazon has links to used copies for as little as $0.01 (plus $3.99 shipping!).

Others have suggested bypassing Pascal in favor of another language, such as C. There's something to be said for this, particularly if you want to learn something that'll translate into marketable job skills. IMHO, Pascal's main limitation is in its memory handling -- or at least, that was the case ~20 years ago. (I've not programmed in Pascal in over a decade.) C gives you much more flexibility on that score. OTOH, C is also a much "looser" language (not just in memory handling), which means it's much easier to dig yourself a deep, dark, bug-filled hole in C than in Pascal. If you're a relative programming novice, starting with Pascal will let you write working programs with less pain and learn good programming techniques in the process; but if you've been programming for a while and understand the basics of things like functions, control loops, recursion, memory management, etc., C will give you more power. Another factor: There

are programming trends and techniques that change over time. Pascal and C both predate some important modern programming techniques, such as object-oriented (OO) programming, so you won't learn OO programming with Pascal. Many modern languages, such as C++, are OO languages. (C++ is an extension of C, so if you learn C, learning C++ becomes easier.)

It seems that your point "without any limitation" doesn't reconcile with
your choice of KDX...

From their website:

Purchasing

Haxial KDX Client costs US$30. You can purchase it at the Haxial Online
Shop. Please download and try KDX before purchasing (yes, we allow this).

Did you miss this:

To connect simply use kdxvcfa.dyndns.ws as the address, a
username/password is not necessary.

I think you will find it only fits one way. The "plug" on the drive has a plastic "tongue" along one side of the pins. The "socket" on the end of the cable usually has a recess on one side that matchs the tongue. I am pretty sure if you try the wrong way it just won't go.

Hi Dave. Thanks for your reply. That's what I would have thought, which
is why I didn't write it down when disassembling. But upon reassembling,
I found that the cable would really go in both ways. See:

http://ryandesign.com/tmp/atari-mega-ste-floppy-drive-power-cable2.jpg

Could someone with a MEGA STE please open it up and see which way the
power cable is supposed to be connected to the floppy drive? Thanks so
much!

i surely accept this input guuys,,,especially rod...so far pascal
isn't that bad and most commands are similar to that of which i carry
up from basic.
but i should remain true to my objective and that is to learn and
obtain knowledge of the language i have choosen, basic was good to
learn program flow , command words along with identification of
variables,and ,strings ....
now pascal has shows areas of libraries , stronger program flow
methods ...quicker procedure ,,,,i guess i'd like to enjoy a steady
learning pace,,,and not jump right in the pointer filled land scape of
'c'
a little about myself , i picked up programming four or five years ago
so i am relitivealy new!!!! having no ideal a symbol from a pointer
from a variable,
sorting this shuffled mess has been quite a task , thanks for
expressing enough interest to guide me past the "nooks" and "cran-ies"
of programming ...i will eventually progress , even if it's years
ahead.

Those particular plugs are the same as a PC's cd audio cable and have no
specific orientation. Cheap and nasty way of doing it, very easy to plug
in backwards. If it is plugged in backwards it can be quite bad as it
would be feeding 12v into a 5v rail. Anyway, B is the right way;-)

Thanks for your reply, Mark. That was exactly my concern! I didn't want
to fry it since I have no replacement. I reassembled it with the cable
plugged in the way you indicated, and it worked.

For the archives: with the Atari MEGA STE opened up and its top flipped
upside-down, the correct way to attach the floppy drive power cable is
with the yellow wire to the right, the red wire to the left.

Dave, I also now see what you meant about the plastic "tongue" on the
plug fitting in to a matching recess on the socket. Well, on my cable
they don't seem to actually fit together much, but I can see how they're
probably supposed to do that.

Thanks again, everyone. Now my Atari is purring along prettily again.

Well, I'd like to know what the compatibility of those different
development systems with the ST serie?
Do they run with a 68030?
Do they support MINT?
Do they support other resolutions than the ST standard ones?

Guillaume.

Hey folks. The thread about the Vintage Computing FIles Archive made me wonder...

If there were to be a worldwide repository of Atari knowledge and/or programs... an Encyclopedia Atarium, as it were... what current online resource might it resemble?

I know that there are (or at least were) several Atari-related ftp sites, but it'd be great if there was one place where you could find everything, wouldn't it?

Ideas? Suggestions?

Hi Joe,

May I suggest you to have a look at <http://eureka.atari.org/atari.html>
that includes a lot uptodate bookmarks about ATARI universe, including
also FTP sites and an *ATARI Search Engine* provided by Google Co-Op.

You may find useful information about the state of our scene.

Best regards,

If I remember well, GFA has a special way to encode the floating values
and uses high speed routines for floating point operations. If a standard
IEEE encoding is not needed, then GFA gives you a real power in that way.
Well, if you have a FPU... then "C" is better!

Francois,

Ah, but think of it... all the available information and applications (free/shareware and public domain, of course) all in one place! Our own version of the Encyclopedia Galactica!... the Encyclopedia Atarium! <g>

I am not, as you may think, ignorant of the state of the Atari world, having been involved, in one aspect or another, in our scene continuously for the past 20+ years.

My question wasn't really "where can I find stuff", but "wouldn't it be cool if we could find it all in one place, and what would the darned thing look like?" I should have been clearer in my original post.

Would the overseeing of such a huge amount of data be prohibitive even for a site that was database driven? Would indexing and re-indexing even be possible with such a huge amount of data?

I took a quick look of eureka.atari.org, and it's quite an impressive collection. But links are an imperfect answer at best. Think about it... how many times in a month do we see "whatever happened to <fill in your favorite site url here>" posts?

If there was one main repository, mirrored at several other reliable locations, we could... dare I say it?... we could rule the world! [grin]

Would the sum-total of all Atari knowledge fit on a DVD-R? A dual-layer DVD? Or would we, perhaps need a special device that could be carried with an individual, and connected to the Encyclopedia Atarium via hyperspace bypass?

It would out=sell the Encyclopedia Amigaum by a large percentage for two reasons... First of all, we'd make the Encyclopedia Atarium slightly less expensive, and second, we would print, in large, friendly letters the words "DON'T PANIC!" across the front.

Naaaaahhh. It's been done. [grin]

Anyway, if someone were to undertake this project, and the sum total of Atari knowledge was collected and deposited in such a place, who would be our 'Mr. Atoz'? (10 geek points to anyone who recognizes that reference)

Joe Mirando

OO originates from Simula in the 60's, so the concept has been around for
decades. There are object oriented Pascal-variants, and IIRC Pure Pascal
is one of them. I haven't used Pure Pascal myself, but from what I've
heard it's pretty similar to the earlier object oriented versions of Turbo
Pascal.

On reflectiuon, the MEGA was produced when Atari was well on the slide to oblivion, so I suspect they used whatever was in stock that would fit, so it could be the "adjusted" a non-standard connector...

# 1308. TeraDesk 3.91 released

Newsgroup: comp.sys.atari.st
Date: 2007-06-22 22:52:30 UTC
From: vdjole@EUnet.yu
Message-ID: <f5hjrc$3q0$1@news.eunet.yu>
Source record: 5221

Hello all;

Version 3.91 of TeraDesk open-source desktop for the 16-bit and 32-bit lines of Atari computers is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

This release brings some small improvements related to formatting and copying floppy disks, several bug fixes and size optimizations (program size has been reduced a bit).

See the history file for more information.

Have fun.

Djordje Vukovic

His rather lengthy text seemed to make a major point about the value
of simply mirroring other's archives, so I don't get the impression
that he is claiming ownership.

In fact, he is correct--copying archives *is* a real value, since it
improves availablility through distributed redundancy.

Behind the STacy4 sticker are two screws that must be removed to allow
enough room to dismantle the case. Beware that it's not an easy task
to reassemble everything.

Hi Peter!

Out of curiousity, I am totally crap at programming. :-)

I think it was mentioned before, that C is not so developed on ST/TT as GFA-Basic is. It's like the older ROM Basic on various 8bitter, some commands can't be faster, not even in Assembler. (obviously a tough compiler, going with GFA, IMHO.)

Although, I find the ST/TT/and higher CPU is one of the best for Assembler programming. Beginning with the 68000 (32bit), of course :-)

Well, as I said I know very less about coding, I would go with GFA-Basic, indeed. And Assembler, if it were my primary-time hobby/fun/work etc.

Best Regards,

Daniel Mandic

I see.. Funny. I haven't looked at PureC/Lattice, but I often study
the assembler code generated by GCC just to be on the safe side. With
optimizations enabled, I often find it hard to beat the compiler by
hand... Anyway, judging by the applications created using it, the GFA
compiler is a lot faster than people might think.

Not sure I agree; GCC is one of the better compilers around imho..

68000 assembler is really pretty, yes.

> Well, as I said I know very less about coding, I would go with

Personally I'd go for C and assembler, but many talented coders have
proven that GFA is a fast and flexible language. If you're using a
multitasking OS, try Lonnys' GBE environment. Truly amazing work.

Yes, there are something like (real) register :). Not to mention the
forward compatibility, e.g. the AMIGA OS was written in Assembler and
C, already with 32bit. A 020-060 can then run the same code, just with
32bit RAM access (if available) instead of 16, or even 8 (68008).

Oh well, I thought there is nothing good C for ST line.

It's just 3 weeks until the third annual Vintage Computer Festival, Midwest edition. We've got a few interesting speakers lined up, and more to be added shortly.

So come all ye collectors, see the speakers, and even exhibit your favorite items from your collection! We still have plenty of space to fill up with exhibitors. If you're interested in being an exhibitor, please sign up before Sunday, July 8th. Don't wait until the last minute, or there may not be space left!

VCF/Midwest 3.0 will be July 14-15, at Purdue University's Stewart center. Speakers will run from 11a to 2p each day, and exhibits and the marketplace will be open from 2p to 6p. Admission is $5 per day for access to the whole event, and kids 17 and under get in for free.

For more details, and to sign up as an exhibitor or vendor, please see the official VCF/Midwest 3.0 website at:
http://www.vintage.org/2007/midwest/index.php

If you have any questions, feel free to send me a message at:
vcfmw at computer-refuge.org.

;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;
lonny , i love pointers and memory blocks...never used memory blocks ,
but i suppose thats the same as dimension-ing an area of memory .
pointers within gfa are my favorite ....*a$ ,,,eh?
is a memory block a reserved area of space ?space for each char value?
1-byte , 2 - word -4 integer,8...16 etc etc for as many

any how keep in mind i'm still learning with little holding me back
from experimenting...by the way , i think i may go back to gfa or
omikron, cause pascal is very bad mannered at the moment.

Hi,

Have you ever been so fan with arcade games to spend
all your spare time playing in pubs when you were teen ?
Have you ever spent nights playing games on your ATARI
computer with friends and family with really good ones ?
One of my "best of" game is out on the PlayStation3. I
played it on my 1040STf in 1986, on my MEGA STE4, on my
Falcon30 in 1993 with "Backward" to slow down the 68030
from 16 to 8MHz and eliminate data + instruction caches.

I mean this arcade game is *Joust* just released on the
_PlayStation3 Machine_ enhanced with network playing.

<http://www.jeuxcherche.com/go.php?ressource=video&id=44465>

You've understood that I strongly recommend it to you.

Will you hit the pterodactyl ?

Have fun :-)

# 1333. [ANN] Fiffi 1.50b

Newsgroup: comp.sys.atari.st
Date: 2007-07-01 07:25:00 UTC
From: Gerhard_Stoll@b.maus.de
Message-ID: <200707010925.a60130@b.maus.de>
Source record: 5247

Fiffi make it possible to access an FTP server. FTP stands for
file transfer protocol and makes the transmission of files between
computers of all kinds of operating systems and system architectures
possible. On FTP servers are often the interesting software archives
on the Internet.

Furthermore, it is possible to upload files on your website.

This Fiffi version based on the source from Jï¿½rgen Koneczny.

You need the following programs for using Fiffi:
- MagiC (Atari, Mac, PC) v4.5 or better and
- IConnect v1.0 or better.

Changes between version 1.3 and 1.50b:
- NEW: When clicking on the path display, the popup is now aligned to
the mouse cursor position.
- NEW: Keyboard control of the FTP window completed:
<Return>: Selected file/directory will be loaded/
opened.
<Control>+<A>: Selects all files/directories.
<Control>+<Delete>: Deletes the selected file, and only these!
- FIX: While Dragging&Dropping of directories to the FTP window,
there is no more halt of the system.

Download program and source:
<http://home.ewr-online.de/~gstoll/>

Thanks to Sascha Uhlig, who translate the docu.

Just wondering... wouldn't it be more sensible to use MagX-Net,
instead of iConnect, as MagiC! is required ?
Why so many stacks for so many apps running on the same
environment ?
Why not allow the apps to behave accordingly to the stack that
is already present in the system ?
There is MiNT-Net ? so it switches to the correct stack and
uses it.
There is STinG ? OK, let's use its protocol.
And so on for others.
That isn't meant as a pure criticism, but just an attempt to
understand why so many wheels that need to be reinvented so
many times. That's rather disappointing for me. :-/
As of today, among the many internet apps that I use, I know
only 2 that don't rely on a specific stack (unless I'm wrong,
of course!) : MyMail and CAT.
For all others, I need GlueSTiK, that slows the system down
and sometimes causes crashes. :-(

OK, I forgot to mention aFTP (patched version), and I couldn't
make MyMail work with only MagiCNet - though I used to, before,
when I didn't have GlueSTiK installed! :-/
I don't know what I did wrong, but I did it! :-(

Hi Guillaume,

I had the opportunity to try your enviroment under steem. Compiling/
linking the demo.c works great. But when I try the same for demo.cc I
always get two bombs when linking. Do you have any idea what is the
problem? Steem is configured to use tos2.06 with 14MB of memory. I
updated the inf files with the correct paths.
Can you please explain what are those LDG files and how to update

them? Do they affect the linking process? Shall I install something in the AUTO folder?

Thanks,
Jozsi

Definitively not! MagiC! is IMHO a synonym for MagiC!, MM and M_PC and
MagX-Net don't run on the last two one...

> Why so many stacks for so many apps running on the same environment ?

IConnect is only 1 stack for a lot of absolute different environments!

> There is STinG ? OK, let's use its protocol.

iFusion (STiK/STinG over IConnect) v1.0 still exist!

> only 2 that don't rely on a specific stack (unless I'm wrong, of
> course!) : MyMail and CAT.

MyMail don't work well on my Quadra840 and CAT supports IConnect and
STiK/STinG on MagiC! but under MM only IConnect works! Only with M_PC
it can use owing to I2C directly the win-stack instead...

# 1343. Falcon Mk X case repair

Newsgroup: comp.sys.atari.st
Date: 2007-07-02 19:16:06 UTC
From: jao-a248@iximail.com
Message-ID: <1183403766.247553.96860@n2g2000hse.googlegroups.com>
Source record: 5156

I have an Falcon Mk X - the recased Falcon that was sold by C-LAB
towards the end of the Falcon days. This is absolutely immaculate
except, that the top cover in one corner has had some holes 'drilled'
in the top with what was probably a screwdriver....

I'd really like to have a go at repairing this, and wondered if anyone
had
ideas. The case is metal, and I thought of using car type filler to
fill
the holes, and then respraying the case.

Anyone attempted this kind of thing?

Cheers.

> wouldn't it be more sensible to use MagX-Net, instead of iConnect,

Fiffi is from 1997. At the moment I'm happy to get source. Maybe I make it that is possible that it can use MagiCNet or MiNT-Net. The next problem is that it run only with MagiC, because it use the threads from MagiC. I saw that there are some change so it can work with N.AES, but I never test it.

> Why not allow the apps to behave accordingly to the stack that is
> already present in the system ?

Because I must support four stacks: IConnect, Sting/StiK, MagiCNet/MiNT-Net and Draconis

> Why so many stacks for so many apps running on the same environment ?

While anybody think he can do it better. But you are some years to late. We have four stacks and must life with them.

# 1347. Releases at NAS2007: aICQ/GBE/x128 emu

Newsgroup: comp.sys.atari.st
Date: 2007-07-02 21:27:01 UTC
From: GokMasE <gokmase@gmail.com>
Message-ID: <1183411621.313807.34400@n2g2000hse.googlegroups.com>
Source record: 5161

Hi all,

NAS2007.
The event was held this last weekend (29/6-1/7in Gothenburg, Sweden.
We had a real nice time and got to see a bunch of both new faces as
well as some of the more wellknown. One of the guests at NAS was kRadD
who has a blogg and some pics at this (rather extensive) URL:
http://twh.homelinux.org/zope/welta/partyfolders/2007/atdemoparty.2007-07-01.7970201294

*GBE 1.51 (GFA Basic Editor)
Lonny Pursells excellent and GEM-friendly GFA editor has been uploaded
just in time for a NAS-release.

*AtarICQ 0.170
The GEM ICQ-client has been updated for the first time since NAS2006
and the number of smaller fixes and adjustments is worth a look.

*Spectrum emulator - x128.
Following the saturday releases of AtarICQ and GBE, yet another piece
of software has been made available during NAS2007. PeP (Peter
Persson) has ported the x128 emulator to FreeMiNT. It needs a fast
machine, and it's a bit tricky to install since it uses his
experimental joystick device drivers. Feel free to try it out though.

Download links for the software releases can be found here:

http://www.sak.nu/

Thanks to all who visited NAS2007 and contributed to a nice weekend!
More pictures from NAS will be uploaded to the SAK-website shortly, so
please check it out from time to time.

Regards,

/Joakim

## 1348. GhostScript Atari

Newsgroup: comp.sys.atari.st
Date: 2007-07-03 00:34:48 UTC
From: phantomm <phantomm@bellsouth.net>
Message-ID: <LQgii.11483$s8.8985@bignews1.bellsouth.net>
Source record: 5162

Greetings,

If I recall, GhostScript could read some .PDF files on the Atari ST-Falcon.
I may have the name wrong.

Is it still available?

Also, has it ever been updated in the last few years?

And is there any other Atari ST-Falcon program that will
read/create .PDF files?

IIRC all of those stacks except one have a gateway that allows their use with MagiCNet. The exception is the IConnect gateway, which was never publicly released (that I know of). If someone could rescue that from Vassilis and, with his permission, release it into the wild?

BTW, as a matter of interest, are you using the DDP Translations resource file from fiffi 1.30 as a basis for 1.50b?

>Can you please explain what are those LDG files and how to update
>them? Do they affect the linking process? Shall I install something in
>the AUTO folder?

No the SCREEN.LDG doesn't affect the linking. If the shell starts with
the background image, then the LDG runs correctly: it's only a collection of
graphic routines.

The problem should be in the linker itself. Does it use other opcodes
than de 68000 ones? (I don't know what processor steem emulates).

Being not a specialist of GCC, I can't help you more.
I mostly used it to compile the MPEG2 routines and then, step by step,
convert them in assembler.

Guillaume.

May be, but the main problem with such gateway is: they're in general
very slow or don't work well...

Thanks for the info, Looks Cool!!

I should have everything needed to run it here.

Will it work with just Plain TOS 4.04 with a FPU or does one need to run
Mint and or Magic?

I still like using Geneva, have nothing against Mint / Magic.
However, I don't like to use alot of Stacks just to work a program,
if ya know what I mean.

# 1359. Atari CDs/DVDs

Newsgroup: comp.sys.atari.st
Date: 2007-07-03 23:26:47 UTC
From: phantomm <phantomm@bellsouth.net>
Message-ID: <ZWAii.21361$19.17642@bignews5.bellsouth.net>
Source record: 5173

Greetings,

I'm looking for collections of Atari ST-Falcon Software Collections
that are on CDs/DVDs. Including Atari 8-bit as well.

Personal Collections
Shareware/PD Collections
Any in Between

After reading mags like ST Format in the past, I remember
seeing PD/Shareware Collections of software from OverSeas.

I'm really interested in Collections like this, if anyone has some
for Trade/Sell/Etc. then send me a discription of the CDs/DVDs
that you have and maybe we can work something out.

I do have some of these, but I know there are some that I don't have
and could make use of some of the software.

Also interested in Atari 8-Bit / ST-Falcon Software for use with external
hardware,
such as DIY kits and the like. I enjoy using my Ataris to control things.
8-)

E-mail your discriptions and etc to me at.......
phantomm@bellsouth.net

Keep it Rockin!
Phantomm

Thanks for the tips - that's a great help. I'll see if I can find the
epoxy.

> What do you think the holes were for in the first place? Sounds odd to
> put some on the top of the case, but if it was musician owned
> previously, one never knows :)

I assume it was for extra "cooling" as its over the PSU, but the Mk X
case already has holes for cooling on the left hand edge so its
a bit odd.

Thanks

jao.

Derryck,
I use an Iconnect gateway with my MagicNET setup. If anyone is
interested and wants to have this setup on there computer let me know.
I will review what it took to get it going and send the appropriate
files and explanation on where all the files are to be placed. As far
as the sources are concerned. I dont have those but I have contacted
the author just this week to see if he would be willing to hand over all
sources including Iconnect, Draconis and MagicNET so continuing support
can be achieved.

Thanks,

Don't know! I don't have any original hardware anymore - I mostly use
MM on a Quadra840 or a G3-MT (with PowerFPU) and there it simply
works! I've also M_PC but Zview don't run on vulgar MC68000...

You're right, I saw the same problem yesterday.
This was not a problem for GCC 3.4.4, the current version on Cygwin.

This problem is trivial to fix. It is just a missing cast.
You just have to modify the line 1536 as this :
char* ptr = (char*)sym.a_name;

Then you will be able to complete your compilation !

I'll upload a new patch containing this fix.

Good luck.

Vincent

Someone with the initials MB at the Cheshunt Computer Club should be
pricking his ears up at this time!

I had a very similar setup to yours, Carey, and it worked very well.
Blessed if I could recall what one had to do to get it working though.

Some years back, someone posted a very comprehensive guide on setting
all this up, including support for multiple news servers IIRC.

> on where all the files are to be placed. As far as the sources are

I guessed that there must have been some unsurmountable problems (with
the IConnect gateway).

> make: *** [all] Fehler 2

You're wrong, you just have compiled gcc !
From your gcc build directory, type "gcc/xgcc --version" to get the proof !

More explications :
I put the build scripts online, but I didn't describe the whole building process (I plan to do it later).

The problem is that the gcc package contains the compiler, as well as libraries dependent on libc (such as libstdc++-v3). But the libc is not provided by GCC ! We must use the MiNTLib as libc (Linux uses glibc, Cygwin uses Newlib). The MiNTLib cannot be compiled if gcc is not installed. The package gcc cannot be compiled if the MiNTLib is not installed :-\

You encountered an error because you tried to compile libstdc++-v3 (from the gcc package) before having installed MiNTLib and PML.

Here is the solution.

Step 1 : binutils
Compile *and install* the binutils. Update your PATH variable to include /usr/local/m68k-atari-mint/bin. You must be able to run m68k-atari-mint-as from any directory.

Step 2 : gcc (Part 1 - Compiler)
Make only the gcc compiler. The key is to use "make all-gcc" instead of "make". You just have to follow my build script up to the comment "Now, compile and install the MiNTlib"

Then you'll build the libraries with this partially compiled gcc package.

Step 3 : MiNTLib
Just follow the build script to compile *and install* the MiNTLib.

Step 4 : PML
Just follow the build script to compile *and install* PML.

Step 5 : gcc (Part 2 - Libraries)
You can now build the remaining stuff in the package gcc with "make".
Just follow the build script where you stopped in Step 2. Install gcc.

That's all ! You should be able to to run m68k-atari-mint-gcc.

In my binaries, I left multilib enabled. It means that all libraries are built multiple times, with some variants and combinations : standard, -mshort, -g, -m68020-60... So building step 5 is very long. When the patches and the build procedure are good, it is not a problem, you just have to wait. But when you are struggling for making it work it is easier and faster to disable multilib. This can be done by appending --disable-multilib on the gcc configure command line. You'll get only 68000 libraries, without FPU, and with sizeof(int) == 4.

Good luck !

Vincent

Hi, does anyone have any Falcon SVGA adapters? UK based.

Cheers!

# 1379. [ANN] Litchi 1.0

Newsgroup: comp.sys.atari.st
Date: 2007-07-05 21:21:05 UTC
From: Pierre TON-THAT <geek@atarians.com>
Message-ID: <468d60c0$0$21146$7a628cd7@news.club-internet.fr>
Source record: 5193

Bonsoir :)

Now final version. Voilï¿½ !
Litchi is a new FTP client, running with tcp/ip stack STiK2, STinG or
compatible.

Download on my homepage or directly in the folder:
http://ptonthat.club.fr/files/ <- litchi10_uk.zip (100 KB)

New features, since the beta3 release:
- bugfixes:
- automatic opening of newly created local folder (final "\" was forgotten)
- remaining space on correct disk (bad parameter in Dfree())
Thanks Cooper/Paradize
- alert #254 and exit, when listing a file more than 2 GB length
The files more than 1 GB length are now skipped from downloading
Thanks JL.CECCOLI
- the Console did not open with the menu item
- display problem of Console window is not topped
+ recursivity for local files and folders contents deletions
+ recursivity for files and folders contents uploads

My goal was to have the same functionnalities of aFTP, so I could
delete it on my hard disk. Development is finished. There may be some
fixes and enhancements, if people want.

Hope you'll enjoy.

Hi all. I'm more of a Mac person, coming late to the Atari game. I'm used to needing to tell the computer that I want to turn it off, using e.g. the "Shutdown" menu option on a Mac, and only then turning off the power. I've also used an Atari STf before, which didn't have a hard drive. Now I have a Mega STE with a hard drive. Can I just turn it off when I'm done with it, or do I need to shut it down through software first? I just don't want to damage the hard drive.

After you've quit any running software you can just turn it off.

Different rules apply if you have alternative operating systems such as
MagiC etc. In such cases, there will most likely be a Shutdown menu
item.

It probably is ours. I asked only because I didn't want too many
different versions out in the wild ;-)

It would have DDP Translations as a credit in the About... menu item.

I just read the docs... Incompatible with 'exotic' file systems such
as 'ext2', is imho a rather big limitation.
Have you confirmed this? Do you know if it's related to the library
you're using or if it's some other issue?
I know problems may arise when using the legacy file system calls, but
doesn't magic support the enhanced file system functions introduced by
mint?

Anyway, thanks for your efforts, Pierre! I'm sure these minor issues
can be sorted out. I think your stuff deserves to be used in freemint
too..

regards

Yes, and once you've down the "Shutdown" procedure in MagiC etc. you
can physically turn off the power with the power switch.

It's funny this subject should come up now because I dusted off my
Mega STe a couple of days ago and having finished working with it I
stopped up for a second wondering if there was a "shutdown" menu to
select or not :-)

I've been in touch with him in the past as well, and last I heard from
him was in January when he told me that the STidem boards were under
manufacture in China. After that, nothing.
At least, since you heard from him in May he's still working on stuff,
which is good.
Perhaps he's just very busy.

# 1392. Ethernet for MegaSTe

Newsgroup: comp.sys.atari.st
Date: 2007-07-06 10:33:01 UTC
From: SixteenThirtytwo <sixteen_thirtytwo@yahoo.com>
Message-ID: <1183717981.311538.231340@g4g2000hsf.googlegroups.com>
Source record: 5056

Apparently the "comp.sys.atari.st.tech" no longer serves its purpose of being the technical discussion side of the Atari ST, but this newsgroup seems to be THE Atari ST group....

I'd like to add Ethernet to my Mega STe (which will be recased, so its physical location/size etc. doesn't matter).

The current solutions using the cartridge port won't work for me since my cartridge port is already full of MIDI expansion devices daisy-chained together. The NetUSBee for example (http://hardware.atari.org/netusbee/netus.htm) doesn't have a "pass thru" port, and I'm worried about data loss or poor performance by joining so many cartridge based devices together.

Then there's the ACSI port (or SCSI through a Link 97) by using a Daynaport SCSI Link (http://www.anodynesoftware.com/ethernet/main.htm). I'll be having a Link 97 connected to the ACSI port on the back of my Mega STe, so at first glance this should work fine, but I don't know if the Daynaport devices have SCSI "thru" connectors allowing for multiple SCSI devices to be connected together in a chain (I'll most likely have a SCSI CD-ROM burner connected to the Link 97 inside the new recased computer, and a new SCSI connector on the back of the computer's case for other devices such as an external SCSI hard drive or ZIP drive etc.).
I also don't know how well this works as the Anodyne link above explained that you needed to deactivate the ethernet driver in order to use the floppy drive.
I was hoping for something more "plug and play" and always available, but is this a common issue when it comes to networking an Atari ST?

The final solution is one that I've never heard about but at least in my mind sounds like a great one: using the built-in hard drive interface of the Mega STe!
I've read (http://atari-ste.anvil-soft.com/html/devdocu6.htm) that the internal hard drive of the Mega STe actually runs off an ACSI port, which seems to imply that the interface board (where the internal SCSI drive plugs into) is more or less similar to an ICD Link or something.

Having heard about the EthernNE adapter which allows for a standard NE2000 compatible ISA networking card to be used with the Atari ST, which is then to be connected to either the cartridge port (being the EtherNEC version, which isn't of interest for me as explained above), but also as an EtherNEA version which uses the ACSI port, that sounded interesting to me.

I assume the adapter is meant to be connected to the ACSI port on the back of any Atari ST, but if the internal hard drive accesses a second ACSI bus, then I don't see why I couldn't connect it there instead. After all, I won't be using the internal hard drive any longer, which would leave the bus completely alone for the sole purpose of networking! Wouldn't this be a whole lot better than sharing the cartridge or external ACSI ports with other devices in addition to networking?

Unfortunately I haven't had any success in getting in touch with the developers of these adapters (Elmar Hilgart and Thomas Redelberger), and there's not enough information available online to etch your own PCBs.

Here are the sites I've found:

http://home.arcor.de/thomas.redelberger/prj/atari/etherne/index.htm (EtherNEA/EtherNEC adapters)
http://www.asamnet.de/~hilgarte/ (EtherNEA and Ethernet adapter II)

I'd like to hear from people who know more about the subject and could possibly help me get hold of these devices, or information about building one myself.

Source record: 5057

Does anyone know how to get in touch with Elmar Hilgart and/or Thomas Redelberger?

I'm interested in adding ethernet for my Mega STe, possibly using the EtherNEA adapter (or the Ethernet adapter II) which have designed by the above two gentlemen, but having used the email addresses shown on their websites repeatedly I still haven't received any replies.
I therefore assume that the websites have been abandoned and those email addresses are no longer used.
Here are the websites:

http://home.arcor.de/thomas.redelberger/prj/atari/etherne/index.htm
http://www.asamnet.de/~hilgarte/

I know I'm gonna get flamed for saying this, but what the heck. Those
devices should be considered obsolete.

You should take a look at NetUSBee (Ethernec replacement), or, if you
really need your cartridge port for something else then maybe there's
a way you can hook up the Daynaport SCSI adapter to the MegaSTe's SCSI
bus.

Failing that, maybe someone who is upgrading to a NetUSBee may have an
EtherNEA they are willing to part with.

Hehe :-)
Things happen quickly on the Internet ;-)

Yes, if someone has an EtherNEA I'd be interested.
Even more interesting is the "Ethernet adapter II" (http://
www.asamnet.de/~hilgarte/) which seems to be a single card which is
the whole ethernet interface and connects to the ACSI port! The page
says "available shortly" while the website was last updated about a
year ago.
Now, if I could only get in touch with the author (Elmar Hilgart) and
find out if this board is actually available, and figure out if the
internal ACSI bus of the MegaSTe will work with this sort of thing...

Speaking of the internal vs. the external ACSI bus; does anyone know
if these are independant buses of each other? I'm thinking that if
they are then the computer might be able to go online without
sacrificing the data-flow of the external ACSI port which I'll be
using for the CD-ROM and possibly an external hard drive, and I'm
hoping the problems with the floppy drive not being accessible (see
the section near the bottom of this page entitled "restrictions":
http://www.anodynesoftware.com/ethernet/main.htm) will no longer be an
issue.

The idea is that I can, with the help of ethernet, be able to transfer
files to/from my Mac desktop instead of messing around with floppy
disks, or burning a CD-R/CD-RW.
It would also be nice to surf the web, but I really don't need that as
my Mac's much better for that sort of thing anyway.
I haven't had much experience in networking the ST, but I do seem to
remember other solutions where the printer or modem port was being
used.
Unfortunately there's no parallell not serial port on my Mac. There's
a modem, but it's built-in. As for the rest of the ports (Firewire,
USB) there's nothing like that on the ST.

So the only solution for networking as far as I can see must be via an
ethernet interface.

Not mine. have you not a GEMDOS partition on your system ?

> Have you confirmed this? Do you know if it's related to the library
> you're using or if it's some other issue?

I said that because I have not tested the behavior with an ext2
partition. I don't want to install mint and reformat my hard disk only
juts to test it.
I was worried by the possible use of unix "/" instead of dos "\".

> I know problems may arise when using the legacy file system calls, but
> doesn't magic support the enhanced file system functions introduced by
> mint?

I use always gemdos functions. File listing are made with the Dopen()&co
funtions introduced by Mint.

> Anyway, thanks for your efforts, Pierre! I'm sure these minor issues
> can be sorted out. I think your stuff deserves to be used in freemint
> too..

Sorry, i'm not a Mint die-hard user. Someone told me it was running under
Mint-NP, but I do not know if on gemdos or ext2 or else partition.

Au revoir.

Fair enough. Hopefully it works, and if it doesn't, it won't be
difficult to fix. Unix paths can also be referenced as normal through
U: anyway. As soon as I have GBE running properly I'll have a look.

> I use always gemdos functions. File listing are made with the Dopen()&co

Good, should work then.

> Sorry, i'm not a Mint die-hard user. Someone told me it was running under

Ah :) No worries - you do the right thing and release the source code
- which is great because then stuff like this can probably be solved
anyway. I think that's great.

have a good one

No they are 1 bus. The card inside the MSTE is infact a poor
implementation of an ACSI<=>SCSI adapter. ACSI is remarkably like
SCSI. It was in fact Atari's attempt to get their own SCSI-like
standard in place before any other competing standard took majority
hold, but both ACSI and SCSI lost out when IDE took over the desktop
market shortly after, but not until SCSI had implanted itself firmly
as the no1 for server systems storage.

The restriction is largely irrelevant if you have a good network
connection and broadband internet access, plus you have another
desktop system. That's more or less my setup. I hardly *ever* need the
floppy disk drive.

> It would also be nice to surf the web, but I really don't need that as

The Modem is a USB modem, sitting on an internal USB bus.

> As for the rest of the ports (Firewire,
> USB) there's nothing like that on the ST.

Again, if you can get a NetUSBee you can have Sting/MintNet networking immediately, and USB drivers will start to appear soon. Firewire on the ST range is largely pointless, as is USB 2.0 High Speed.

> So the only solution for networking as far as I can see must be via an
> ethernet interface.

If you really cant get rid of the stuff in the cartridge port and get a NetUSBee, you're gonna be relying on hack-ups with the ACSI bus. Not nice.

Just for interest - what you got in the cartridge port thats so important?

I already have HDdriver (can't remember which version, but I haven't
updated it for years).
Yes, the Daynaport solution is probably the simplest way to go (and I
assume those outdated ethernet adapters for the Mac platform are dirt
cheap these days), but I'm a little concerned about the limitations
mentioned at the Anodyne site about the floppy drive being
inaccessible while being online.
Since using an ethernet connection gives that side-effect, does it
mean that I possibly can't use an SCSI device (connected through the
Daynaport) before I access the STiNG settings and turn off ethernet?

I'm trying to set up a *simple* and efficient system. Not the kind of
computer where you have to remember to change a certain setting before
doing task A, but if doing task B turn it on, while remembering to
disable C and D, but not E... if you catch my drift.

I would guess that a dedicated ethernet card for the VME port would be
the best solution, but those cards are near impossible to find these
days (and very expensive when they do pop up).

Was surprised to see a USB/parallel cable at Wal-Mart yesterday for $20.
Probably could be had for less on the internet. Under the impression the
ST's parallel port wasn't bi-directional though. USB/serial cables exist
too. Should be even cheaper. Slow but the easiest to implement. Probably
need a null modem cable or adapter too.

Had a Falcon connected to a PeeCee a long time ago via serial and it wasn't
too bad once I had Zmodem working on the PeeCee. Seem to recall leaving the
Falcon and MegaST4 on all night occasionally to transfer files via MIDI(33K
IIRC). Still better than sneaker net even if they are side by side. May be
possible to mod the ST serial port to run at MIDI speed. Never tried it.

Like I said before, I don't think the temporary loss of FD drive is
gonna cripple your workflow.

> I would guess that a dedicated ethernet card for the VME port would be
> the best solution, but those cards are near impossible to find these
> days (and very expensive when they do pop up).

I have a PAM's VME ethernet card, which works great in MiNT on my TT,
I seem to remember getting it working also in Sting, but I'm not 100%
sure. Because I have NetUSBee now which frees up my VME slot for my
GFX card, I don't need the PAM's card. Maybe I could sell it if you
are interested.

I wanted to buy one of the serial ones for my Mac so I could use older
non-usb devices but alas, the cheap one I saw when I checked the mfr
website, there was no Mac compatibility info.

> Had a Falcon connected to a PeeCee a long time ago via serial and it wasn't

The earlier MegaSTe's serial port runs quite well only at 57600 bps
(still faster than the midi port), and the later MegaSTe (which had a
better SCC) and the all TT's (AFAIK) can run reliably at 230400 bps.

Maybe, but I hate to have to remember to switch on/off things in
control panels or what have you. After a while if you don't use the
computer for a while you tend to forget these things and wonder what
the heck is the reason for this and that not working.

Yes, I'd be interested in hearing more about this card. I've never
heard of the PAM card before and searching the web didn't give any
useful results.
Does it have an RJ45 connector, and would this solution give a better
result and with less complications than the ones where the ACSI
interface is used?

I don't run MiNT, only TOS 2.06 and MagiC. Since the computer will
become a dedicated MIDI computer I will run it mostly in TOS, so the
ethernet card would have to work within TOS.

Once installed in my MegaSTe and with the correct drivers, how would I
transfer files from the Atari to my Mac? Will the Mac appear on the
TOS desktop as a drive and it's just a matter of drag & drop, or is it
a bit more complicated than that?

Oh, too bad :-(
So I would probably have to turn off STiNG (and temporarily lose
network access) every time I needed to use the floppy drive, just like
when connecting a Daynaport ethernet adaptor to a Link 97/Link II
etc.?

> > As for the rest of the ports (Firewire,

I was just pointing out that none of the ports on the Mac are
compatible with the MegaSTe, so I really do need an ethernet port in
order to communicate between the two.
That is, if the communication between the two are worthwhile. If it
takes 30 minutes to transfer a few files from the MegaSTe to the Mac
I'd probably be better off just getting Anodyne's CD-burner software
and burn data to a CD-RW.
My whole point of looking into networking on the MegaSTe is for
transferring (and occasionally backing up) files on to the Mac, where
I have proper access to the net if I need to share any Atari files
with others, and better/faster CD (or DVD) burning options for backup.

What do you mean? Apart from the need to switch on/off STiNG depending
on whether you want network access or floppy drive access, are there
other negative side effects of using the ACSI port for networking?

> Just for interest - what you got in the cartridge port thats so
> important?

A bunch of MIDI related hardware. The recased MegaSTe will end up being a specialized and dedicated MIDI computer, so removing any of those devices is out of the question.

Yeah, I understand this. The grey matter is not too good for retaining
this sort of info over time. Now Post-it notes, theres another
story :-)

> Yes, I'd be interested in hearing more about this card. I've never

The PAM's VME card is almost the same card as the Reibl VME card. It
uses the same chipset (Lance), but there was enough of a difference
that it needed it's own driver. Both of these cards only have a BNC or
AUI port, which requires the use of a dongle (which I have) to convert
to RJ45.

> I don't run MiNT, only TOS 2.06 and MagiC. Since the computer will

I can't give advice on Magic, as I don't use it (only tried it for a
while, and never with networking), and in TOS, you would be using
Sting, and from memory I think it was working fine, but I'm not sure.
If I have time to play with it I can check it out, but I'm currently
trying to get the USB mouse driver ready.

> Once installed in my MegaSTe and with the correct drivers, how would I

As usual its a bit more complex, but the way I do it is to have an
automator script saved on my desktop where I just drag the file(s) to
the script's icon, and then it automatically connects to the Falcon
(via FTP) and drops the file(s) into a pre-designated directory there.
Of course for this you need an FTP server on the Atari (included in
MiNT, and I know there is at least one that works with Sting). If you
want to do it the other way around, you will need to enable your FTP

server on the Mac (in sharing preference panel) and get some FTP client on the Atari. Again, with Magic, I cannot advise, but someone else here will be able to fill in the holes.

Probably. Unless someone (Roger?) finds a way around this in the
driver.

> I was just pointing out that none of the ports on the Mac are

Right. There is no other easy way around this.

I mean because the SCSI card is internal, so if you're considering
adding a SCSI/Link you are gonna need some adapters inside the STe, a
double cable to connect the adapter and your existing hard disk, and
some sort of termination power (which is probably already provided by
your other gear). In my books, this is a hack-up. I love this stuff,
though it's not good if your machine is a 'production' machine (which
it sounds like it is).

Can you be a bit more specific? The reason I ask is that most cartridge port stuff I see for musicians these days is extra midi-in/outs, or dongles. When I have some time I'm going to look into the possibility of making a driver for a cheap USB midi port device that will interface with CAF.

Reminds me. I never got the Falcon and PC connected at the fastest
speeds(this was ~10 years ago). Probably about what the MegaSTe runs. Forgot

the MegaSTe had a faster serial port.

A program that uses Zmodem is needed on both computers. Using Ymodem or anything older just isn't practical. I used STalker on the Falcon & MegaST4.

Take a look at <http://www.myatari.net/issues/feb2002/samba.htm>. I
haven't read the whole thing, so I'm writing this from the perspective
of connecting from the Mac to the MSTe.

Assuming! that that suits your purpose then, in the Mac Finder, go to
Go/Connect To Server... and enter "smb://<your MegaSTe's dotted quad
address>". You may also need to go to Network Prefs and turn Windows
Sharing on.

You can go to Network Utility and give your STe's IP address a name if
you want. I can go to my TiVo's web server (at 192.168.1.9) by simply
entering "http://tivo" in the address bar. You'll need to look up the
specifics on how to do this.

You could also set up an ftp client as Coda suggests, but this is much
better if you can get it running (better integration), BUT you will get
.ds_store and .trash files piling up on the Atari.

To transfer files between the PC and my TT I used the WFTP server on the
Atari and a GUI based FTP client on the PC. This did allow drag and drop on
the PC but not on the normal desktop.

Bonjour :)

Monsieur JF.LEMAIRE has reported me deux bugs. Many Thanks to him.

- division by zero an exit. This happens when file is small and CPU + Net is very quick, upload or download is lesser than 200ms.
If this happens, please deselect the stats 'flow for each file' (the first one, select by default in the stats).

- can't delete a remote folder, evenif empty.

These bugs are fixed now on my computer, but i do not want to bother users with a release every week, so please wait next month, and apply work-arounds.

Apologizes for the inconvenience.

It seems that solution is mainly for MagiC. While I do have MagiC (I
think it's version 4) I will use the MegaSTe mostly in plain TOS (with
the "Thing" desktop) as my MIDI software doesn't work with MagiC.
And although I have a boot-selector (Superboot) where MagiC is one of
the choices, it'll be a hassle to reboot just in order to transfer a
file or two over to/from the Mac.

> Assuming! that that suits your purpose then, in the Mac Finder, go to

Yes, this sound exactly like what I've done when networking a PC to my
Mac. Once set up correctly it works like a charm.

> You could also set up an ftp client as Coda suggests, but this is much
> better if you can get it running (better integration),

I guess under TOS you're bound to run into limitations because of the
lacking multitasking. Even though I would prefer a streamlined
solution where I could just drag and drop the files on to the Mac I
can handle starting a program on the MegaSTe for the purpose of
transferring files (e.g. FTP), get the files transferred, exit the
application, then get back to what I was doing.
Come to think of it, the ACCessories are a basic form of multitasking.
Would it be possible to do the file-transferring via an ACCessory or a
CPX module?
That way I could possibly do without exiting my MIDI sequencer
(Notator SL) just to enter the TOS desktop (or "Thing" if I can
sacrifice the memory) to do the file-transfers.

> BUT you will get
> .ds_store and .trash files piling up on the Atari.

There are several (free) solutions to this problem.
Since I've transferred files to/from my mobile phone and camera memory
cards I needed to look into it.
Check out the following MacOS X software:

Finder Cleaner (http://www.findercleaner.tk/)
DeStore (http://www.soja.org/destore)
TinkerTool (http://www.bresink.com/osx/TinkerTool.html)

With TinkerTool you can change "hidden" features in MacOS X.
For the above issue, just go to the "Finder" section where you'll see
an option for turning off the ".DS_Store" feature over networks.

The above will be no problem as it'll all be placed inside a 19" rack
enclosure.
I will be connecting a Link '97 to the ACSI port and TERMPWR on its
appropriate pin for that, from the computer. The TERMPWR pin on the
other side (the end that goes to SCSI device(s)) will have its TERMPWR
pin separated so there's no chance of problems if say an external hard
drive has power applied to that pin.
An SCSI "through" connector is pretty standard, so I wouldn't call
that hacking.
Everything would be neatly placed inside the 19" rack enclosure with
external connectors being made on the rear panel.
Shouldn't be any problem at all.

CAF=Cubase Audio Falcon?
Specifically I'll be using Notator SL in conjunction with dedicated
MIDI hardware connected to the cartridge port. At the end of the chain
I will also have a "Discovery" cartridge which has allowed me to back

up copy protected floppy disks which are near impossible to get replacements for these days:

MegaSTe -> Combiner -> Log3 -> Unitor2 -> Discovery

I also have a buffer-board which I can insert somewhere along the chain to boost the signal, although I haven't quite decided where yet. I don't think any other hardware can take these C-Lab/Emagic cartridge devices' place as they're very specific to the software.

The Discovery cartridge has a cartridge "thru" port where I could theoretically add say a NetUSBee or one of the other networking solutions which go on the cartridge port, but I don't know how well that would work with that long chain, and especially when a "Combiner" (a cartridge expansion device) is used first in the chain to select which cartridge to use.
Finally there's no "thru" port on the NetUSBee, which is a bummer.

This is why I'm still interested in hearing more about your VME networking card.

I wish you all the best with the USB MIDI port. It's great to hear that people are still designing hardware for this platform.
Any chances of creating a USB board which will allow for USB printers, now that Centronics interfaced printers are becoming a rarity and most people these days have a second computer (PC or Mac) with a USB printer attached.

> compile and install the MiNTlib"

Just a word about what I call "follow the build script".
I qualified the build scripts as "semi-automatic" because they are not intended to be run directly. They sometimes need some manual interventions. And they don't support error checking.

I simply open a console (rxvt under Cygwin) and I copy/paste every line (or group of lines) then I wait for the result. It is quick and easy. But sure, a Makefile would be better.

I have just uploaded a new patch for the MiNTLib. My initial one, combined with the settings of GCC 4.2, resulted in a bad return value of memcpy. Now it seems to be quite correct, I've been able to cross-compile native binutils for MiNT.

Good luck.

There is also the commercial Porthos, available via Ulf Dunkel of
Calamus fame, which works well, though very slowly (as does
GhostScript) - not really surprising with a slow processor.

No. Notator SL doesn't work with any other OS than TOS.
Nothing to do about that as the program is no longer supported.

Fortunately I can run a better desktop on top of TOS, such as "Thing"
which greatly improves the experience, even though it steals a little
memory which I would otherwise like to use for Notator. Oh well.
And if you really investigate TOS 2.06 there's a whole lot of cool
things you can do. I wrote a TOS 2.06 guide several years ago. It's
still available:
ftp://gem.win.co.nz/hall/tos_206/guide206.zip

> I don't know of any TOS solutions to D&D, but setting your Mac up as an
> FTP server is easy enough. As for file transfer via ACCs or CPXs, hmmm.

Well, if I can't do drag&drop from the Atari desktop I'm at least
hoping for a standard Atari GUI application in order to transfer files
back and forth. Please don't tell me I have to resort to a UNIX like
command line. I used to think that sort of geeky thing was cool, but
am way past that. It's all about user-friendliness and getting things
done these days.

TinkerTool has a "revert to default settings" so no problem.

As with the other software I suggested; they don't mess around with
the system and work in more or less the same way as BlueHarvest, but
as far as I know, BlueHarvest is more automated and extensive, so you
can forget about it and let it do its thing in the background.

I've got an "old" (bought in 1999) iMac. The only external connections
it has on it are a 100mb Ethernet port, two USB ports on the main
computer unit, a two port USB hub on the keyboard, and a phone connector
for the modem. No serial (other than USB), no parallel, nothing a stock
Atari would come close to recognizing.

http://www.macwise.com/Keyspan.html

It's made to connect to the Mac's USB and a serial(not USB) cable. The cable needs to be a null modem cable or adapter because both computers are expecting a modem. The null modem swaps TX & RX.

A printer/parallel port can be added that way too. USB can convert to a lot of other standards. Don't even know if the serial and parallel ports work on the PC I built in 2001.

# 1429. Problems booting MagiC

Newsgroup: comp.sys.atari.st
Date: 2007-07-09 09:30:37 UTC

It's been a while since I've used my ST, so I've forgotten all the small details...

So as to have different options I installed the "SuperBoot" boot-selector where one of the settings is MagiC/Thing. I can't remember which version of MagiC I have, but from memory I think it might be version 4.

Anyway, what happens is that when it comes to booting into MagiC and the "Magxboot" application runs, the floppy drive spins for a while (I suppose it tries to boot from the floppy is there's one inserted), then shortly after I get the following error message which locks everything up:

Bildschirm-treiber nicht gefunden.
MCMD wird gestartet...
System wird angehalten.

I first assumed this had something to do with NVDI not being assigned properly, but then I disabled NVDI when rebooting, but still got the same error message.

After a quick search of Google[0], there's the possibility that
something may have corrupted the magx.inf file.

[0] which can't find the phrase "MCMD wird gestartet" but can find MCMD
"wird gestartet".

I suspected something like that, which is why I tried creating a new
MAGX.INF file by using MagiCconf (the folder is actually called
"MCONFPRV", not to be confused with MAGXCONF which only works with
MagiC 5 or higher).
Still no luck in getting it to work.

I do however have MagiC working from another (external) SCSI hard
drive. I'll see what I can use from it and get the one on the internal
hard drive to work as well.
In the meantime, if anyone has any good suggestions or ideas I'm all
for that :-)

I am working on checking out all the files that I have loaded onto my Falcon that were given to me by the MagicNET author. I assume that you are running high-speed internet of some sort??? I will try and gather up all of the MagicNET and patches for all of the gateways (Draconis, Iconnect and such...) I will leave them untouched from my settings so that we can work together on finding what information will need to be changed on your end.

I will be in touch by e-mail shortly....

# 1435. [ANN] CDLab 0.92 released

Newsgroup: comp.sys.atari.st
Date: 2007-07-09 22:00:41 UTC
From: DOCs <"docs ifrance.com">
Message-ID: <4692b00f$0$22948$426a74cc@news.free.fr>
Source record: 5099

Tuesday, July 10th 2007,

CDLab 0.92 is available.
http://doyeuxyvan.free.fr/cdlab/v0.92/CDLAB092.ZIP
A CD-R burning tool for Atari-compatible computers.

---
New features since 0.91 version
---
- Better AIFF implementation.

- New audio formats for audio extraction. ( AU/SND, AIFF, AIFF Cubase Audio ).
- Filenames mask for audio extraction.
- Interface improvement in Monochrome.

---
Main features
---
- Audio track extraction.
- CD-RW blanking function.
- DAO (Disc-At-Once) copy for any single-session discs. ( But it doesn't work with my MMC compliant drive )
- Data CD Mode. ( TAO (Track-At-Once) multisession mode. )

You need the SCSIDRV interface. ( already included in HDDriver )
You can also run this program before CDLab.
http://doyeuxyvan.free.fr/scsidrv/SCSIDRV.PRG

CDLab is now released under terms of the GNU General Public License.
The source code can be retrieved here:
http://doyeuxyvan.free.fr/cdlab/v0.92/

Original Francois GALEA website:
http://fgalea.free.fr/cdlab/

I'm using a standard 56K Modem and a pay as you go service.

Just to give you some background. I have two Falcons (there is a
third somewhere) which I wanted networked and to get a broadband
connection. Both are running Magic 6.20 & NVDI 5.03.

Falcon one is in a tower case with CT60 running at 100MHz.
Falcon two is in a C-Lab Mk X case with CT63 running at 90Mhz.
I have two EtherNat's and two CTPCI's on order.

>I will be in touch by e-mail shortly....

I'll look forward to hearing from you.

I have a later model 1040STFM and a dying MegaFile 60. I guess the old RLL mechanism is nearing its end.

What I'd like to do is remove the guts of the MegaFile, and insert a SCSI host adapter and more modern SCSI drive mechanism (I have a few working 4GB drives) into the MegaFile case. Before I begin this endeavor, I need to locate a SCSI adapter. I've seen a few ICD models, as well as the one from an Atari SH204 available.

Are there any real functional differences between these that would make one preferable to another?

Second, my 1040STFM currently has TOS 1.0 ROMs installed. Although it is a STFM and not an STE, it uses a 2-chip ROM set, and not the 6 chip set like earlier STs. Does this mean I can install TOS 2.06, or am I limited to version 1.4 unless I do motherboard mods?

Thanks.

Jason Harmon

Yes you are limited to TOS 1.4 unless you do the mod, because TOS 1.6+
resides at a different physical address.

# 1439. WTB: Atari boxes (outer box)

Xbox 360 to Get 65nm "Falcon" Makeover This Fall
Brandon Hill (Blog) - July 9, 2007 2:17 PM

"Yippee-ki-yay, Mr. Falcon." Microsoft prepares 65nm chips for Xbox
360

When it comes to Microsoft's Xbox 360, Dean Takahashi always seems to
have the inside scoop.

Today, Takahashi confirmed that Microsoft's upcoming 65nm die shrink
for the Xbox 360's microprocessor and GPU will is codenamed "Falcon."
Takahashi reports that Microsoft is currently qualifying the new
Falcon chips along with a redesigned motherboard. The 65nm-equipped
Xbox 360s are due to hit store shelves this fall.

The new chips are not only smaller and roughly 50 percent cheaper to
produce than their 90nm counterpart, but they are also cooler. Cooler-
running chips coupled with a revised cooling solution would go a long
way to eradicating the Xbox 360's fatal flaw: the Red Ring of Death
(RROD).

Heat has been a big problem with the Xbox 360 and has been the root
cause of RROD cases around the globe. Microsoft has countered the RROD
failures by increasing the warranty of the console, adding various
"warranty enhancements" and beefed up cooling solutions on new
production Xbox 360 units.

Microsoft ultimately caved in to mounting pressure from the Xbox 360 community on RROD failures and announced a $1 billion initiative to service Xbox 360s afflicted with the problem and extended warranty coverage for those machines to three years.

http://blogs.mercurynews.com/aei/2007/07/microsofts_next_move_code-name_falcon.html

Microsoft's next move? Code-name Falcon

By Dean Takahashi
Monday, July 9th, 2007 at 12:02 am in General.

Here's a trade secret that Microsoft is unlikely to publicly acknowledge.

Sony's cutting the price on the PlayStation 3. How will Microsoft react? We'll find out soon. But a key part of the strategy is going to be a project code-named Falcon.

Falcon is the name for the latest internal electronics in the Xbox 360. It will have an IBM microprocessor and an AMD/ATI graphics chip that are manufactured in a 65-nanometer production process. These are cost-reduced chips that do the same thing as their 90-nanometer predecessors, but they're smaller.

With smaller chips, Microsoft gets a bunch of benefits. They won't generate as much heat. So the risks of overheating - one of the main reasons behind Microsoft's billion-dollar write-off for repairs and extended warranties - are much lower. The chips may also cost half of what it took to make them before because they use less material and fewer manufacturing steps to produce.

Everyone knows that console makers cut the prices and costs on their consoles over time. But you may not be aware that the primary chips - microprocessor, graphics, and the Ana video processing chip - are the bulk of the cost of the machine. Microsoft started making the Xbox 360s in August, 2005, with a 90-nanometer process. It is overdue to switch to the newest technology, 65 nanometers, but that day has finally come. It may be some time - a year, maybe two - before it moves on the a 45-nanometer process.

But it's worth it. I recall that Ken Kutaragi said that by moving along the semiconductor manufacturing cost curve with the PlayStation 2, Sony was able to reduce the size - and therefore cost - of the PlayStation 2's original chips to just 13 percent of the original over the life cycle of the PS 2.

If you cut the costs on the chips, you can cut the overall cost of the system. You get ancillary benefits such as using a smaller motherboard, more air flow inside the console, and the ability to take the big giant power supply in the Xbox 360's power brick and put it inside the console.

Microsoft is in the process of qualifying the new Falcon chips and motherboard this summer. I expect it will launch Xbox 360s with the

new Falcon innards this fall. That is why the company has been able to say that it has solved its manufacturing quality problems. Microsoft is likely to spend a little more money on heat sinks to make sure that the overheating problem doesn't resurface with Falcon.

The good thing about the smaller chips is that they will likely be easier to make in mass quantities and they shouldn't fail as often. Quality should automatically go up. That's what folks said about the 90-nanometer generation. But the 65-nanometer production process is a known quantity at this point at places such as IBM for sure and possibly at other suppliers such as Taiwan Semiconductor Manufacturing Co. So rather than fix the problems with the 90-nanometer machine, Microsoft has the easier problem now of getting a 65-nanometer machine to work right. I suspect that is why Robbie Bach, president of the Entertainment & Devices group, said on Thursday on a conference call with analysts that the company has "its hands around it at the engineering level."

But once this machine is in the field, Microsoft will have a few options. It can take the power brick and put it inside the same chassis. It can also make a smaller version of the core, but this involves considerable redesign and retooling resources. And it could also beef up the console and make room for more costly things - as it did with the Elite.

It's anybody's guess as to what Microsoft will do with the Falcon as its base platform going forward. But Sony had better watch out. Microsoft is moving ahead of Sony on the cost-reduction curve. It would be risky for Sony to get into a price war with Microsoft.

Now it's easier to see why Microsoft still expects to be profitable in fiscal 2008 with the Xbox 360 business. In this fiscal year, Microsoft will introduce a major cost reduction with the Falcon platform. It will launch Halo 3. And it has already written off in fiscal 2007 the costs of repairing consoles for the next few years.

Falcon is a fundamental part of the strategy that Microsoft is using to try to beat Sony. Is it going to be good enough to beat Nintendo on costs? Very doubtful. Nintendo can play the cost-reduction game just as Microsoft can. Falcon certainly means that Microsoft can afford to cut the price of the Xbox 360 going forward. Whether it does so depends on how aggressive it wants to be at winning the lead market share in the business. But everyone knows that if you cut your hardware price too much, you lose money. After all, Microsoft lost an estimated $3.7 billion on the original Xbox.

When I asked David Hufford, a Microsoft spokesman, about Falcon on Friday, he said I was telling him something new. When I asked Peter Moore, head of games at Microsoft, about Falcon on Thursday, he said, "We have a bunch of different projects that cost reduce and improve quality as you find issues, as does our competition. Once you get millions in the field, you learn about the box under all kinds of

different circumstances, you can adjust and tweak what you do accordingly."

Microsoft develops new Xbox 360 chipset

Mark Androvich 18:51 (BST) 09/07/2007

Reduces overheating risk, cuts costs

Microsoft has developed a smaller chipset for the Xbox 360, allowing the manufacturer to cut production costs.

Dean Takahasi, writing in the San Jose Mercury News, reports that Microsoft's new chipset is code-named "Falcon."

The new chipset has an IBM microprocessor and an AMD/ATI graphics chip that are both manufactured in a 65-nanometer production process. The original chipset was manufactured in a 90-nanometer process.

The smaller chipset both reduces the risk of overheating and lowers the production costs associated with the Xbox 360.

Microsoft has not yet officially announced an Xbox 360 price reduction, although the move is expected by many analysts, including Michael Pachter.

The "Falcon" chipset redesign would certainly be a step towards a price reduction. The Xbox 360 has now been on the market for nearly 20 months without a drop in price.

July 9, 2007

Report: Microsoft Looks To Cheaper Chips To Lower Xbox 360 Costs

Report: Microsoft Looks To Cheaper Chips To Lower Xbox 360 Costs San Jose Mercury News journalist Dean Takahashi has reported that Microsoft could be looking to a new internally redesigned Xbox 360, codenamed 'Falcon,' as a means to not only reduce production costs, but also reduce the console's price at the retail level as well.

According to the report, Microsoft plans to replace its current 90-nanometer chip manufacturing process with a less costly 65-nanometer process, resulting in smaller, more efficient microprocessors and graphics chips for the Xbox 360.

The result, according to Takahashi, will be internal electronics that generate less heat, and thus result in consoles that are less prone to the infamous 'red ring' general hardware failure error, the driver behind Microsoft's recent warranty extension. The 65-nanometer technology also makes for much more possible room within the Xbox 360 hardware, which the report speculates could be used to house the

console's current brick-style power supply in future models.

In addition, as the chips themselves make up the bulk of the console's manufacturing costs, the savings from the shift to the new process could eventually be passed along to the consumer by way of a less expensive Xbox 360.

When questioned about the Falcon project, Microsoft's Peter Moore declined to confirm such an initiative, instead telling Takahashi, "We have a bunch of different projects that cost reduce and improve quality as you find issues, as does our competition. Once you get millions in the field, you learn about the box under all kinds of different circumstances, you can adjust and tweak what you do accordingly."

Code-name Falcon: Xbox 360 Gets 65nm Chips
By: César A. Berardini - "Cesar"
Jul. 9th, 2007 9:09 am

E3 Media & Business Summit 2007

Dean Takahashi has the scoop on the updated Xbox 360 system that will finally make use of the microchips built using the a 65-nanometer manufacturing process:

Falcon is the name for the latest internal electronics in the Xbox 360. It will have an IBM microprocessor and an AMD/ATI graphics chip that are manufactured in a 65-nanometer production process. These are cost-reduced chips that do the same thing as their 90-nanometer predecessors, but they're smaller.

With smaller chips, Microsoft gets a bunch of benefits. They won't generate as much heat. So the risks of overheating - one of the main reasons behind Microsoft's billion-dollar write-off for repairs and extended warranties - are much lower. The chips may also cost half of what it took to make them before because they use less material and fewer manufacturing steps to produce.

http://www.next-gen.biz/index.php?option=com_content&task=view&id=6298&Itemid=2

Microsoft Readies Lower-Cost 360

Microsoft is reportedly readying a revised version of the Xbox 360, codenamed 'Falcon', in a bid to reduce production costs.

According to a Mercury News report, (a reputable source of Xbox news) Microsoft will switch to a 65-nanometer production process, meaning new consoles will feature smaller microprocessors and graphics chips as opposed to the 90-nanometer processors found in current models.

The smaller, more cost-efficient 360 innards will add a range of benefits to the system, while lower production costs would also facilitate any plans for a future price drop.

If these new production methods are implemented, overall console reliability would be increased. The risk of overheating, an issue that has strongly been linked to the three red lights of death failure, would also be reduced, while more space would be freed up inside the console itself. The report speculates that this new space could be used to house the current brick of a power supply that comes with 360s.

Microsoft is reportedly in the process of qualifying the new Falcon chips and motherboard, with 360s containing Falcon innards expected to hit retail this fall.

"We have a bunch of different projects that cost reduce and improve quality as you find issues, as does our competition. Once you get millions in the field, you learn about the box under all kinds of different circumstances, you can adjust and tweak what you do accordingly," said Peter Moore, head of games at Microsoft, when questioned about Falcon.

Goodness knows what MCMD is, or whether it's only started if MagiC's
offscreen drivers can't be found!

Anyway, it's symptomatic of a faulty installation of MagiC which might
be repaired by copying any missing files (these are *.ofd files IIRC?)

Bonjour

SixteenThirtytwo a ï¿½crit :
> Bildschirm-treiber nicht gefunden.

When you install MagiC, you have to specify a partition where MAGIC.RAM
will find its X:\GEMSYS\ folder, where X is C, D, or else.

MagiC video drivers and GEMDESK\MCMD.TOS are located in this MAGIC.RAM.

If you change the location, then you must reinstall. MAGIC.RAM is signed
with key and informations (included this path for GEMSYS) when installed
and cannot be copied as you want.

Other possibility is that your MAGX.INF is not correct, probably saved
with a CR or LF line-end instead of CR+LF.

I think you're on to something because it somehow worked when I copied
the entire "GEMSYS" folder over from the external hard drive.
Still, not everything is working properly even after having messed
around with the "MAGX.INF" file using "MagiC!Conf" (MCONFRV).

After several years it's all pretty confusing as I can't remember
which files do what, which variables to set, which config files to
edit etc.
As far as I can see I've had a pretty complex setup with a boot-
selector, MagiC, Thing and various "helper" applications and
enhancements.
Is there a MagiC FAQ somewhere? I could need some explanation of the
various entries in the MAGX.INF file including the environmental
values.

I remember a very nice MagiC website years ago, but alas it's gone. I
think it was this one: http://www.magical-sides.de/
An outdated website would have been better than completely removing
it :-(

Well M$ is making his own an ATARI historical success.

If you don't know about the ATARI machines, you don't need to read
this newsgroup about ATARI computers. You don't need furthermore to
post on c.s.a.st newsgroup.

There's ATARI "Falcon" 30, I have a standard version of it that I bought
in 1993. And now Falcon 60 thanks to Rodophe Czuba and the CT60. I
personally have a Hades 60 since 1996. All these are my devel machines.

If you don't believe me, read the following page and follow the link
about my Eureka 2.12 software.

<http://www.kingx.com/kingx/medusa/thes.html>

I'm submitting an information that is seriously linked to the ATARI
world. Read about it !

ATARIstically,

Ok, so you are saying that you are not aware that "Falcon" is a common
english name, which existed before Atari or decided to continue in the line
of "animals" brands like "Lynx" and "Jaguar" ?

If you find an historical article about "Apricot" machines, don't forget
posting a message in the Apple newsgroups, they will be very happy to see a
totaly relevant post.

Man, that's pretty harsh, don't you think? The point he's trying to make is exactly what my first thought was upon reading your post and the information linked to it... Just because Microsoft decided to name their chip "Falcon" doesn't mean it has anything to do with Atari beyond a coincidental same name as the Atari computer. I don't think Mr. Pointier meant to say he didn't know anything about Atari computers, or even that he didn't know that the Falcon and other machines exist. He and I (and others) are just trying to figure out why you think this information is so important to us. I personally don't care what Microsoft codenames their products. I don't use them. It really has no link to the Atari Falcon at all except for the name.

Yep, having access to sources is valuable in such a case. From what I can tell, Litchi will run happily under FreeMiNTs memory protection if compiled with a decent GFA library. At least I managed to compile the program using Run!Lib and I have not noticed any problems with that binary under memprot so far.

Would there be any problems with ext2fs I can for sure try and have a look at that here. I'll await next bugfix update of Litchi before doing any further tests though.

Ho well ... We're on an ATARI newsgroup. A new machine called "Falcon"
means something for ATARIans. You can't ignore it !

Furthermore, we're on comp.sys.atari.st meaning that we're supposed
to talk about "ATARI Computers". We're not talking about birds or
about consoles or portable consoles, nor 8-bits. Xbox is strictly
speaking not a console, but a *nextgen machine* ... You may understand
that, or you are fooling me !

For me, a nextgen machine that is called "Falcon" really chock me !
I supposed some of you would be interested with that, as I am.

> If you find an historical article about "Apricot" machines, don't forget

You're kidding !

Did <http://fr.atari.com/> had some responsibility in that dirty trick ?
We will never be able to speak about Falcon without thinking of it :-(

Ho yes, but that is not all there is !
I think that these machines called "Lynx" also must be of great
interest to all ATARIans. Really !

This is vital information that seriously is connected to the ATARI
today !
I'm sorry, but if you deny this fact you should never power up your
ATARI again. If you refuse to believe these facts, read this:

http://www.brp.com/en/Products/Lynx/Showroom/

You can put "Falcon" in your killfile because it is an Xbox.
You can put "ATARI" in your killfile because it's a French company
editing games for many consoles and nextgen machines you have cited.
You'll be satisfied with nothing to read/comment in this newsgroup.

You're an American who live like 20 years ago, in your own world ?

I'm not.

Lucky for your, you don't read French. That preserves you from the
endless drivel he posts on the French newsgroup. And I'm not
exaggerating. It must be seen to be believed. Well, actually, you're
much better not seeing it. Just take my word for it :-)

Cheers,
JFL

Hehe, well if it is anything like the endless babbling we see here at
times I am very happy that I don't understand French indeed!

It is funny to see someone who is strictly speaking for himself,
trying to convince everybody else that they are wrong ;)

Who are you speaking about boy ? Speak first for yourself, please.

Is that a personal opinion ? Is that the opinion of Belgian peoples ?

If something shocks you boy in my ideas, then clearly express for
yourself the contradiction ! Otherwise is just the gossipping of a
coward nasty boy. You're kidding ?

What I would say is that it makes much ado about *nothing*.

He even 'explained' me that there were no 3D games before Alone In The Dark.
When I told about Elite, Flight Simulator II, Mercenary... He replied
that I was confusing 3D and isometric games.

Funny for a while, but better in killfile :)

Simon

Then you want to hear about "Alone In The Dark" so please look

<http://corporate.infogrames.com/2007/04/alone-in-the-dark-1.php>

the *ATARI Corporate Site* and you'll understand what it really means.

When I saw the post from FLC I immediatly rechecked if I'm not reading
the wrong newsgroup (fr.comp.sys.atari instead of
comp.sys.atari.st). :-)
Saddly I realized that he starts flaming the english atari newsgroup
with his game console crap...

But as I'm a curious kind of person I read all replies to his message
without actually reading his message :-D. I'm wondering if somebody
really did read it...

Philipp

These allegations are pure *xenophobia*

Jean-François LEMAIRE is Belgian, Philipp Donzé is Swiss. They are
speaking French, and just decided that French ATARIans don't deserve it.

ATARI rules !

Just because there was an Atari Falcon (only seen by common folk like myself hitting ridiculous prices on eBay, rather than in the flesh, sadly), use of the word "falcon" need not be worried about like some territorial issue. Come on, that's really silly.
Other than the sharing of the term, quite a popular name for marketing, I'd imagine, and let's not forget that it is marketing departments who choose these names.... this bears no meaningful connection to the ST family.
If the most important thing about the Falcon was its name, it wouldn't be important at all.

> means something for ATARIans. You can't ignore it !

Please consider these questions:
1. Is the Microsoft project compatible with the Atari Falcon?

2. Does it contain any Atari hardware that's not also common to most
machines?

3. Is it related to the Atari community in any way other than a generic
word that happens to have been used for one of Atari's computers?

If *any* of these are yes, then I agree that this is important.
Otherwise, no, it means nothing for Atarians, and I can indeed ignore
it, no matter what you call it.

> Furthermore, we're on comp.sys.atari.st meaning that we're supposed
> to talk about "ATARI Computers". We're not talking about birds or
> about consoles or portable consoles, nor 8-bits. Xbox is strictly
> speaking not a console, but a *nextgen machine* ... You may understand
> that, or you are fooling me !

Yes, we are supposed to be talking about Atari computers here. What does
XBox have to do with an Atari? So what if it's a "nextgen machine"? It's
not an Atari, no matter what they codename the dumb thing.

> For me, a nextgen machine that is called "Falcon" really chock me !
> I supposed some of you would be interested with that, as I am.

There's a Unix browser called Lynx. I've seen cars with XL and XE in the
name. I've seen products here and there with an ST in the name. I've
even seen a lamp store with a logo that looked strangely familiar (it
was extremely similar to the fuji symbol). None of it ever made me think
that any of these things were important to the Atari community (except
maybe the Mint version of the Lynx browser).

Sorry, but I'm just so confused as to why you think this is so important.

Better and better! I'm French, and I think exactly the same (and all
readers of fr.comp.sys.atari think the same and are anger against you,
you are alone), shame on you, I hope other non French people will
understand that other French people are not like you!

Go speek about Atari games, PS3, Xbox etc. on atari.com forum or on
other specific forum for game, not here or fcsa, it is our freedom.

Olivier

Don't worry Olivier, we all know that French people in general aren't
self proclaimed Atari prophets suffering from serious megalomania.

So far it is just one bad apple, and he is just as unpopular here in
comp.sys.atari.st as in the French newsgroup from what I can tell.

Regards,

/Joakim

Mr. Olivier Landemarre,

We all know that you banished me from your <http://www.lutece.net/>
portal that used to be the commercial place for an housesell agency,
without any sensible reasons, exactly the 1st of April 2006, the day
of the anniversary of the 19th year release of my Eureka 2.12
software. That I was consequently banished from E-mail address and
WEB site, tough I had no job since 2 years at that moment, and
living with social allocations.

We all know that you're not an ATARIan, because you only owned a
520ST when you were young, and that you require real ATARIans for
your activity (I'm one of these poor victims) because you don't
have any interest in ATARI hardware, but only with emulators.

There is also a proof of what I'm telling, because E. Baranger
was another victim of your "activity" because you denied him the
publication of <http://myaes.lutece.net/> with the very famous
distribution of ARAnyM that he maintains with his proper software

<http://ebmodel3.atari.org/Pack_3D/>

We all know that you are against European Political Construction
because you were making a buzz against the European Constitution,
what I really couldn't bare, because you have primal conceptions.

I don't know what point of non return you will reach against me,
but the main thing I can say is that you're one of my best enemies.
I'm not wishing you the "St Olivier" because you haven't any humanity.

I always told you, but I'm repeating it : LEAVE ME ALONE !

ATARIstically,

--

Though it's not ethical to laugh on someone's misfortunes or defects,
it's sometimes really funny about him :D

LOL = MDR = Mort De Rire !

Sorry about this french product. "We are the nation that invented ballet
and the souffle and FLC". Our troll should have remained locked in the
fr.comp.sys.atari, but he learnt English somehow. You're lucky that he's
a bit lazy about writing English posts. We have to endure and read HUGE
ones.

Dï¿½soliï¿½, "I hope this scum has not in-con-weenienced you"

Really?!!!!!! Look at this address one day!

> without any sensible reasons, exactly the 1st of April 2006, the day

Quite strange affirmation, fully wrong, you never use email address
with lutece.net always atari.org. Web site ok I bane you after you
have freely insulting me, but never you have put the real address,
always you mention eureka.atari.org, and I not remove it before you
have put a new one on an other server. You never pay anything for this
service, this was fully free for 5 years I think.

If I said you what was my problems when you have start insulting me,
probably you will have shame of you (oh no you will not you never
shame of you), and prefer your problems than mine!

Really, I have always my STf! No interest in hardware, strange I work
on a coldfire card, and this probably more difficult than compil
software from others. Strange from someone that only see Aranym as
solution, to put in on PS3 and wan't to said: This is an Atari
Hardware, the proof? Atari made game on it!

>

Really?!!! I have very good relations with Emmanuel and yes I was not
agree that it put myaes on his distribution for two reasons:

- For a time you put him against me
- MyAES can't be used (for wdialog) without use of commercial software
(not free! You know this softwares made by other and sailed that you
not have permission to redistribute!)
Very strange because Emmanuel still use MyAES and some day's a go I
send him an alpha version of MyAES, because soon (probably after
hollydays) we think do a specific version of this pack where it will
be probably easy to choose the AES!

Of course you not have my permission to use MyAES for your own pack,
it is not a game, develop on an emulator, this is not serious!

Since that lunatic is in my killfile (and may I strongly urge everyone
to do the same?) I had missed that beauty. And though I generally
refrain from participating in these threads, I can't resist now because
the notion of Philipp and I being xenophobic anti-French, only because
we are French speakers from other countries, is so *unreal*... that I'm
at a loss for words. This is one of the most insane sentences I've read
in my life.

The reality is that we hate the French because their country is bigger,
their wines are better and their women are more pretty. Though I have
my doubts about the latter.

Cheers,
JFL

>> means something for ATARIans. You can't ignore it !
>
> Please consider these questions:
> 1. Is the Microsoft project compatible with the Atari Falcon?

No. But you've certainly heard about, so far as I know you, the
projects that ATARI Corps had founded with the Falcon when they rapidly
shipped the Falcon30. The successor to the Falcon30 was really awaited.

> 2. Does it contain any Atari hardware that's not also common to most
> machines?

The machines may have changed, but ATARI is still there. The primary
known capacities of the ATARI production were game softwares with
"Pong" and arcades. That is very well known.

We're far from <http://www.fr.atari.com/index.php?pg=product&id=448>

> 3. Is it related to the Atari community in any way other than a generic
> word that happens to have been used for one of Atari's computers?

When a so powerful firm is naming a games machine, specially a nextgen
machine, with the "Falcon" code name, it is undoubtedly related to
the ATARI projects.

> If *any* of these are yes, then I agree that this is important.
> Otherwise, no, it means nothing for Atarians, and I can indeed ignore
> it, no matter what you call it.

I'm feeling concerned with this. You may also be concerned, as I am.

>> Furthermore, we're on comp.sys.atari.st meaning that we're supposed
>> to talk about "ATARI Computers". We're not talking about birds or
>> about consoles or portable consoles, nor 8-bits. Xbox is strictly
>> speaking not a console, but a *nextgen machine* ... You may understand
>> that, or you are fooling me !
>
> Yes, we are supposed to be talking about Atari computers here. What does
> XBox have to do with an Atari?

Well ... Many peoples have projects about new ATARI machines. There's
hardware projects mainly around ColdFire, and a Virtual Machine that was
initiated by Milan GMBH and concreted with ARAnyM <http://aranym.org/>

What on earth can we do if we have the most famous company that
makes ATARI projects its own strategy ? It will simply wipe out
all wishes that you ever dream about GEM, MiNT or alternative
to the IT mainstream.

> So what if it's a "nextgen machine"? It's
> not an Atari, no matter what they codename the dumb thing.

You're not really measuring the effect of the dirty trick.

>> For me, a nextgen machine that is called "Falcon" really chock me !
>> I supposed some of you would be interested with that, as I am.
>

> even seen a lamp store with a logo that looked strangely familiar (it
> was extremely similar to the fuji symbol).

Well ... But Apple is the company that produced the Beatles pop group ;)

> None of it ever made me think
> that any of these things were important to the Atari community (except
> maybe the Mint version of the Lynx browser).

Have you heard of the trails of Apple (Inc.) vs. Apple (Beatles) ?

> Sorry, but I'm just so confused as to why you think this is so important.

Well. So far as I'm concerned by the ATARI history, and all founded
hopes that ATARIans had about the new machines that would follow the
Falcon30, I'm really concerned with a nextgen machine called "Falcon".

I personally own a PlayStation3, on which I'm willing to run ARAnyM.

Best regards,

The sad thing is that this paragraph was probably as much on topic than the original thread was :)

I'm really sorry for all readers of c.s.a.s, because if Fran�ois reach his cruising speed, he will write tenth of ridiculous threads per week, about all and everything, insult people, publish personal information, and in the end never excuse to anyone for what he did.

As a French person myself, I feel the need to present preemptive excuses to everybody here: You will need some real strenght to endure that - or good kill files -.

Dbug (who know at least one very pretty girl in belgium, has a MegaSTE but no PS3)

# 1487. [ANN] Studio Son 2.093 beta FR & UK

Newsgroup: comp.sys.atari.st
Date: 2007-07-12 22:00:36 UTC
From: DOCs <"docs ifrance.com">
Message-ID: <4696a48e$0$25856$426a74cc@news.free.fr>
Source record: 5002

Friday, July 13th 2007,

Today, it is not a day of bad luck because there is the new release of
Studio Son for your Atari Falcon.

Studio Son 2.093b is available in the wonderful french language:
http://doyeuxyvan.free.fr/studioson/std2093b/STD2093F.ZIP

The english version can be found here:
http://doyeuxyvan.free.fr/studioson/std2093b/STD2093E.ZIP

You can, of course, find the classic 68030 and 68030+68882 versions in these
archives.

I have performed a lot of hard tests to check the quality of my algorithms.
I have written a lot of different DSP and C programs to obtain correct
results. But, it is still a beta version, so be careful with your samples !

This version has been tested with an original Falcon 030 with a 68882
coprocessor. The CT60 card is not officially supported.

```
-----------
Bugs fixed:
-----------

- Better WAV, AIFF and AVR formats implementation.
- Space disk remaining bug fixed.

----------------------------
New features and bugs fixed:
( since 2.09b version )
----------------------------

- Rewritten "Apply Effect" function. Studio Son does not need a temporary
file any more.
- You can now create with "New Sound File..." blank AIFF, WAV, TRK,
SND and AVR files. WAV files created are always 8 bits unsigned and
16 bits signed with little endian format ( Intel ). Either are always big
endian format ( Motorola ).
- You can create you own sample frequency.
- New management of external DSP effects.
- New useful alert boxes added.
- AU/SND files header write error fixed.
- Several loop errors.
- The approximative hi-speed play has been disabled.
- Icons draw bugs.
- Intempestive play.
```

- DSP effect restore bug after effects changes during a play.
- Reverse stereo with Invert function.
- Block undraw after a Scrub.
- Undo after the "Replace" function.
- Reverse stereo of echo-delay DSP effect.
- Record from cursor.
- Pause with SPACE while recording under Magic.
- Crashs when filtering under Magic fixed.
- For a resample process under Magic, internal file management fixed.
- Significative noise reduction of plopping sounds as long as you use Studio Son.
- Management improved of AIFF files compatible with Cubase Audio. These files are now saved with a physical size rounded to 1024 bytes multiples. Useful to prevent crackling noise when you import your AIFF files with Cubase Audio.
- Buggy "Scrub" function rewritten. No crash occurs.
- Reverse stereo bug for a "Scrub" fixed but still in beta test mode.
- Buggy "Cross Fade" function improved. Autocorrection for wrong parameters. The UNDO is also correct.
- Cut, Copy, Paste, Insert and others have their UNDO bugs fixed.
- Bug of the current working folder fixed. ( After an Insert for example )
- DSP effect after a Resample and Filtering is now restored with no problem.
- Overall settings saving are now re-enabled ! Up to date, you MUST keep the STUDIO.SYS folder.
- Rewritten "New Sound File" function. You can now create a file with the fileselector, choose a frequency, ...
- Rewritten "Apply Effect" function. Sample gap subtly fixed. Due to the DSP real time application of this function, it is obvious that it remains a very small gap into your final sample. This gap is usually filled by zero values as it has been thought for this rewritten function. So, it's not recommended to apply an effect to a block selection.
- Markers management bugs fixed. ( Delete, saving and loading procedures )
- There was play error with "Preview Cut" function. It's now okay.
- Block selection with SHIFT+TAB to the next marker has been debugged.
- Sample time length is now updated after any UNDO.
- Little bug fixed during a play actived by the space bar with an exported sample from Studio Son.
- Resampling function added ( Linear Interpolation ).
- Resampling function includes a filter and linear interpolation code in only one DSP program.
- You can resample from 2 Khz to 192 Khz.
- WAV files opening issue fixed.
- Huge undo bug fixed.
- Huge bug of the volume of mono samples filtered fixed.
- FIR filters ( Low Pass, High Pass, Band Pass and Band Reject ) up to 2048 coeefficients.
- Resample process can be followed by a LowPass filter up to 1024 coefficients.
- DSP Filter algorithm improved. The speed of the treatment have been increased. Now you can enjoy a good optimization of the filtering process.

- The end of the sample is now truly filtered.
- Vu meter clipping problems fixed.
- The cursor running is now correct when sample frequency is not the same as the system frequency.
- Desktop background pattern modified to improve the work in monochrome.
- Redraw bug of the desktop in monochrome corrected.
- Several dialog boxes fields bugs fixed in monochrome.
- Crashs at very high zoom levels fixed.
- You can now really select all the sample with the mouse.
- You can now really place the cursor at the end of the sample with the mouse.
- Wrong size of the blocks at the end of the sample corrected.
- You can now create a block with a "one sample" size when you make a long click on a part of the sample.
- New alert boxes for the Filtering and Resampling function.
- New internal undo for the Resampling function.

New function "Resample..." allows you to change the frequency of your samples with a linear interpolation and an optional Low Pass filter.
The "Filtering..." function enables you to carry out FIR filters ( Low Pass, High Pass, Band Pass and Band Reject ).
This is performed by the DSP 56001 and with Direct to Disk process.

---
Known bugs:
---

- No sound when playing very high frequency samples.
- Slowly WAV files opening.
- Selected block after a resampling task is not deleted.
- Sample duration and time counter are wrong when the system frequency doesn't match with the sample frequency.
- Unable to reduce physically the size of a sample when you cut blocks.
- In the time counter, the value 99 is followed by 10.
- Several little bugs into the sample window.
- The icon of the function "Generate Low Frequencies" differs with the colour of the resolution.
- Little bugs of sample drawing.
- Random error messages when filter steepness is very low.
- Minor bugs.

Up to date, you MUST keep the STUDIO.SYS folder with Studio Son program file.

If you are using Studio Son on a single TOS, I strongly recommend the launch of ARROWFIX.PRG in the AUTO folder:
http://doyeuxyvan.free.fr/studioson/std2093b/arrfix15/

If you are using NVDI, just run ARROWFIX.PRG after this.
Otherwise, GEM must be copied in RAM with the program GEMRAM.PRG before running ARROWFIX.PRG:
http://doyeuxyvan.free.fr/studioson/std2093b/GEMRAM16/

If you have troubles to run Studio Son under Magic, you can use the patch DSPSLOW1.PRG by Centek included into the package or you can find it here:
http://doyeuxyvan.free.fr/studioson/std2093b/DSPSLOW1.PRG
Don't run DSPSLOW1.PRG if you launch Studio Son under TOS otherwise you might have display or DSP locked issues.

You can also use the nice DSPXBIOS patch by Didier Mequignon:
http://perso.wanadoo.fr/didierm/files/dspxbios.zip
http://doyeuxyvan.free.fr/studioson/std2093b/dspxbios.zip

If you use an external clock, run FDI_INIT.PRG into the AUTO folder:
http://doyeuxyvan.free.fr/studioson/std2093b/FDI_INIT.PRG

FPATCH2.PRG is now included in the package.

You can also download self-extracting STZIP unpacker:
http://doyeuxyvan.free.fr/stzip26/STZIP26.TOS

Have fun !

Yvan Doyeux

IIRC, the maximum hard disk partition size supported by TOS 1.0 is 16MB. I understand that later TOS versions increased this limit, but I haven't located definative information on what the max sizes supported by the various TOS versions are.

Does anyone know the maximum partition sizes supported by TOS 1.4 and 2.06?

I have a spare 4GB SCSI mechanism that I am am planning on hooking up to an ICD ADSI adapter, and would like to get an idea of how much of that space will be usable.

Thanks.

Jason Harmon

The maximum for TOS 1.04 is 256 MB, for TOS 2.0x and TOS 3.0x it's 512
MB, for TOS 4.0x it's 1 GB. Bigger partitions are possible when running
MiNT or MagiC.

Many thanks for your hard work!

P.S when you say the CT60 'not officially supported' I am wondering if
you have a CT60/3 to test with? Is it known to work, or are there
known problems? I am asking because I can probably find some time to
test it on my CT60 falcon at some point.

## 1493. CD-ROM support while booting

Newsgroup: comp.sys.atari.st
Date: 2007-07-13 09:20:22 UTC
From: SixteenThirtytwo <sixteen_thirtytwo@yahoo.com>
Message-ID: <1184318422.699012.173310@d55g2000hsg.googlegroups.com>
Source record: 5007

I successfully installed the necessary software to be able to read
from an external SCSI CD-ROM drive a few years ago, but I can't
remember all the details and am now trying to figure out an irritating
fact.
Everything works perfectly if:

a) the CD-ROM drive is turned on
and
b) a CD (with readable IS-9660 data on it) is inserted into the drive
and is ready for use.

However, if the drive isn't on when the computer boots, then the
drivers aren't loaded and I'm unable to use it later, when turned on.
I guess this sort of makes sense even though it would be nice to have
the drivers load regardless of the CD-ROM's current status.

The next problem is more frustrating however..
If I *don't* have a CD inserted in the CD-ROM drive (or the tray is
open), then the driver software won't load either! Actually the
computer seems to freeze at a certain stage in the boot process.

Here are some more details of my setup:
The computer is a Mega STe with an internal SCSI drive connected to
the original internal Atari SCSI host adapter card. It's set at SCSI
ID 0 and is unterminated, just as I've read and been told numerous
times (failing to un-terminate the drive can lead to burning up the
host adapter I've been told).

The SCSI CD-ROM drive (actually a burner) is connected via a Link 97
to the ACSI port on the rear of the Mega STe. I also have an ICD Link
II, but it didn't recognize the CD-ROM drive, so I suppose it uses
arbitration, which the Link 97 supports, I've been told. The CD-ROM
drive is set to SCSI ID 3 and is terminated.

When it comes to software I've first got HDdriver 6.13 which, when
booting, gives me the following information, which tells me that it
recognizes both SCSI devices:

ACSI 0.0: Quantum LPS540S
ACSI 3.0: Yamaha CRW4416S

Next, it loads a bunch of AUTO programs, the ones concerning the CD-
ROM drive being as follows:

Atari MetaDOS (April, 2 1997)
Version 2.74

... and then:

Spin! /SD 0.34

... and finally the one which gives me problems:

SCSI-treiber v5.00

.... with a CD inserted I get a bunch of confirming messages, but
without a CD inserted or the tray open when the CD-ROm drive is turned
on I get the following message which stays there indefinitely

Scanning busses....
ACSI... 00

At this stage, all I can do is reset the computer.
Is this normal behaviour of this setup? I know there are other
software solutions around for enabling CD-ROM reading support, but I
was aiming for a free one, at least to start with.

Hal

> At this stage, all I can do is reset the computer.

Actually I just noticed that if I turn off the CD-ROM drive, the boot
process continues with a "not loaded" message concerning the CD-ROM
driver.

Please note (you might have missed it) that *any* TOS 1.0x version
supports partitions of 256 MB, i.e. the TOS 1.00 and 1.02 ROMs also
support 256 MB partitions.
Using TOS 1.04 or newer is nevertheless a good idea.

I had problems before trying to boot my Stacy with a partition >31Mb,
I think at the time I was using AHDI. I don't know if there was any
reason for this, maybe something I did.

There were limits with RAM-based (i.e. the very first) versions of TOS,
and maybe with very old drivers. But with a ROM-based TOS and a driver
not older than maybe 15 years it should work.

This is what we have. CD support is far from satisfaying. You should
go on some comercial solution.
Writing CD drivers from hobby is simple not possible - there is too
much documentation required. It costs time and money.

Everybody is free to try these values (provided one finds a software that allows creating these partition sizes for TOS 1.04 and 2.0x). I do not recommend it because one risks a loss of data. The permitted partition sizes have been well-known for years since some people had a close look at TOS and the maximum values in particular for the number of bytes per sector and the number of sectors per cluster.

Julian Reschke's SPIN! is (or at least was) available for free, which IMO means that he wrote it as a hobby. I doubt that writing a CD-ROM driver needs more time than writing a hard disk driver, and there are also free hard disk drivers.

By the way, there is a way to use data CDs without a CD-ROM driver, but it requires a CD-ROM drive that supports 512 physical bytes per sector. In particular with old CD-ROM drives there were jumpers to configure this. With such a drive one can write a sector copy of a hard disk to the CD and then boot from it with HDDRIVER.

The issue isn't that I want to boot directly from a CD, but rather
that I don't want the computer to freeze if it boots without any CD in
the CD-ROM drive.
Will buying commercial CD-ROM software ("Extendos" from Anodyne?) do
away with this problem?
Is there other software that I could try out to see if it solves my
problem?

I think so, just ask Anodyne. The computer freezing is definitely not
normal when no CD is inserted. I have never had this problem with my Atari.

I will gladly try it. Just missing couple things: SCSI CD drive and
French knowledge.

I correct myself: writing CD driver which will work flawless for more
than 50% of Atari users is very demanding. Free solutions what I tried
are very limited.

What kind of software are you using in order to read CDs?
If this behaviour isn't normal then I might have entered something
incorrectly in the config files.
Anyone else using free CD-reading solutions and *don't* have the same
problems as me?

I also noticed that I can't read CD-RW discs. I tried burning a CD-RW
disc on my Mac, using the ISO-9660 level 1 format just to be sure I
wouldn't get any problems, but the CD looked blank when attempting to
read it from the Atari ST CD-ROM drive (Yamaha CRW-4416 SCSI CD-
writer).

> > Is there other software that I could try out to see if it solves my
> > problem?
>
> You can also try out SPIN!, but I do not know a current download link.

I believe that's what I've been using all along.
I really can't remember the details of my setup, but IIRC I needed
several pieces of software in order to make a complete setup able to
read CDs; HDdriver is a crucial part of this, isn't it? I'm using
version 6.13.

Looking into my AUTO folder I find the following configuration files:

BDCONFIG.SYS (BetaDOS ASCII config file)
BD9660F.SYS (part of BetaDOS? A binary config file or something)
ISO9660F.DOS (also part of BetaDOS? Binary file)
CONFIG.SYS (ASCII config file for Spin!)
METADOS.PRG (BetaDOS? MetaDOS?)
SPIN_SD.BOS (Apparently a file belonging to Spin! Binary)

I think that covers it.
I don't know of any current site/FTP location that carries Spin!
either as I just installed it from my own download archive throughout
the years. I don't know if there's any newer version than 0.34 which
is what I have.

Looks like a file leech dressing it up as a good willed vintage tech/info preservationist. All that information can be easily found elsewhere in vintage computing community proven archives, and if it is not, then it means that there are a couple of copyright hurdles that prevent from doing so - got to respect that regardless of we enthusiasts liking it or not.

Thanx. On some forums and Wiki sites are those 'optimistic' values.
It will make some discussions there...
Just to add that myself observed troubles with 1GB partition under
TOS 2.06.

boy, you're still wasting your life, aren't you?

still also waiting for Apple to die? After all, you predicted that
Steve Jobs would "destroy Apple before he even got started" and called
him an "arrogant bonehead". (Even funnier when Steve helped turned
Apple's fortunes around and you began licking his boots :) )

Still waiting for Sony to license Virtual Game Station?

And how about Mike Harris (now totally disgraced after Ipperwash) and
Conrad Black (expected to be growing old in the pokey for a long time
after being found guilty for the behavior I complained about and you
poo-pooed as "jealousy")

Oh, and how about that Pointcast "wiping Atari users off the face of
the Web"? Too bad that it crashed and burned while Atari users are still
surfing the web :)

Oh, have you checked out that Canadian dollar? Soon to be at par with
the US and expected to surpass it thanks to the efforts of your moron
president - whose only saving grace seems to be that he's at least
smarter than you :)

yep, same ol' iDiot Forever Known As Sinclap. Still a clueless little
troll without two rocks to rub together for brains, and still being
laughed at by Atari users (not to mention any women when he tries his
stupid "macho stud" talk).

Go home, son, joke's over :)

Sounds to me like your computer is treating an inserted CD ROM disk as
a removable drive, and is barfing when there isn't a disk inserted, or
the tray is open.

I can't speak for the combination of drivers that you have, but
Anodyne's has a setting in the config which allows the continuation of
booting in case of error IIRC.

You mean the CD disc itself, and not the CD-ROM drive?
I suppose the drive should be treated as a removable drive, but not
the disc itself. So perhaps the computer is *not* treating the CD-ROM
drive as removable media, but as a normal hard drive, and since the
data is missing (i.e. the CD disc isn't available) it freaks out.

> I can't speak for the combination of drivers that you have, but

I might have to buy Anodyne at some stage if I want to burn CDs (which
again depends on how successful I am at setting up some kind of
networking connection with my Mac), but I want to keep on trying this
free solution.

As for my setup files, perhaps someone can see if there are any
obvious mistakes which is causing my problem.

First, here's CONFIG.SYS which resides in the AUTO folder:

```
; Beispielkonfiguration für SPIN!
; CD-ROMs auf ACSI 3
*BOS, c:\auto\spin_sd.bos, A:3

; als logische Laufwerke X: installieren
*DOS, c:\auto\iso9660f.dos, X:A
```

... then there's BDCONFIG.SYS which is also found in the AUTO folder
and is a lot longer. Those are the two ASCII config files.
I don't think any of the other files are user-editable, so I can't
have made much damage there ;-)

```
;------------------------------------------------------------------------
;File name: BDCONFIG.SYS Revision date: 1998.08.27

;Purpose: BetaDos configuration Creation date: 1998.02.27
;------------------------------------------------------------------------
;(C)1998 by Ronald Andersson Email: dlanor@oden.se
;------------------------------------------------------------------------
;The first four entries are commented out, partly because you may not
have
```

```
;a CD-ROM to use them for, and partly because I have no distribution
rights
;for the BOS drivers. They are from the SPIN distribution by Julian
Reschke
;and from ExtenDOS, and are what I use for CD-ROM access on my
Falcon030.
;
*BOS, c:\auto\cd.bos, A:3.0
;;;*BOS, c:\auto\spin_sd.bos, B:14\0
;;;*DOS, c:\auto\unidrive.dos, X:A
*DOS, c:\auto\bd_9660f.dos, X:A
;
;One DOS driver above is my own, and is a slightly improved ISO9660F
version.
;This has been completely restructured, so as to simplify adding new
abilities
;(when I get time for that) such as support of long filenames and
Dopendir etc.
;
;The filesystems below are my own, though 'Cook_FS' was inspired by
Julian
;Reschkes 'CookieFS'. His pioneer effort in producing new DOS sources
gave
;me the impetus (and needed knowledge) to start the BetaDos project.
;
;Cluster.DOS implements a drive that holds a 'cluster' of other
drives, that
;are presented as subfolders, similar to the U: drive of MagiC and
MiNT.
;The main difference is that this one works in SingleTOS as well...
;As yet many features of U: are still missing of course (\proc, \dev,
etc.),
;but some of these will be added later (especially link stuff).
;
;For SingleTOS users I recommend editing the 'V:0' of Cluster.Dos to
'U:0'...
;Or like me, use both. V: can also be used under MagiC and MiNT, so
it has
;proven a useful medium for symbolic links that can be used
identically in
;all available TOS systems, with or without multitasking. I use it a
lot !
;
*DOS, c:\auto\cluster.dos, V:0
*DOS, c:\auto\cook_fs.dos, X:1
;
;Cook_FS is just another cookie filesystem, based on exactly the
principles
;and methods in Julian Reschke's CookieFS. It has been completely
recoded
```

```
;though this did not motivate many changes, except where it concerned
the
;new object linking method, which enforced some changes.
;
;As yet these filesystems can be considered FreeWare, but I make no
promises
;as to what policy I will apply regarding future versions...
;
;In addition to the 'classic' MetaDOS commands, BetaDOS now also
supports a
;new command '*SLB,' Identically to how that has been implemented by
Julian Reschke in his MetaDOS enhancements. So BetaDOS remains MetaDOS
compatible.
;
*SLB, c:\auto\slb_load.ovl c:\gemsys\magic\xtension
;
;Only one such command per BDCONFIG.SYS file is meaningful, and the
path at
;the end specifies the default path BetaDOS will look for .SLB files
in. If
;the SLBPATH environment variable is used, this replaces the default
path
;with a proper path list. The *SLB, command is still needed though,
because
;if it is not used BetaDOS will ignore the new GEMDOS functions
Slbopen and
;Slbclose, so the shared code libraries will not be accessible then.
;Thanks go to Julian Reschke again for providing much info on the SLB
stuff.
;-----------------------------------------------------------------------
;End of file: BDCONFIG.SYS
;-----------------------------------------------------------------------
```

# 1521. WTD T Shirt Logo

Hi

For years I always wanted a cool T shirt with the Atari logo on...
even moeso when Atari disappeared!

So I have just got an iron-on transfer film sheet and thought I'd
have a go at doing my own. BUT anyone got a large logo equivalent of
what, 48 point or higher? I could get away with equivalent of A5 for a
Medium standard T shirt...

Any colour, just the Fountain logo would do...

Thanks if you can help

Mark

What I find amazing is that there are any discussions at all. For more
than a decade there has not been a new version of TOS and the partition
size limits for all existing versions of TOS are well-known. These are
limits hard-coded in TOS, i.e. they will not change anymore.

Message-ID: <f7dnoo$sk2$02$1@news.t-online.com>
Source record: 5035

Hi Hallvard!

S>; Beispielkonfiguration für SPIN!
S>; CD-ROMs auf ACSI 3
S>*BOS, c:\auto\spin_sd.bos, A:3
S>
S>; als logische Laufwerke X: installieren
S>*DOS, c:\auto\iso9660f.dos, X:A

I don't recommend using letter A for the XBIOS drive letter, albeit
Julian states otherwise in spin.txt. Instead, I've set it to the
same as the actual drive letter of the device. So, I'd set

; Example configuration for SPIN!
; CD-ROM on ACSI 3 as XBIOS drive X:
*BOS, c:\auto\spin_sd.bos, X:3

; install as logical drive X:
*DOS, c:\auto\iso9660f.dos, X:X

Will avoid any misinterpretations, too :-)

MetaDos will read config.sys, and subsequently start spin_sd.bos and
iso9660f.dos with the parameters given. Spin_sd is the driver for
the hardware, iso9660f implements the CD filesystems.

S>... then there's BDCONFIG.SYS which is also found in the AUTO folder
S>and is a lot longer.

That's for BetaDos, and I haven't fiddled with that one myself.

With best regards
Ekkehard

Along the lines of a Syquest or Zip drive without an inserted disk.

I think you will have to buy Anodyne's solution TBH.

> the hardware, iso9660f implements the CD filesystems.

So the whole CD-ROM driver thing is based on a "modular" system rather
than a single driver file! Pretty smart as it should make it easier
for people to add new "modules" with additional features :-)

I just found out that my version of BETAdos (not METAdos) wasn't the
latest one available. I had version 3.09 while I located and
downloaded 3.12 at the Belgian FTP server's CD-ROM directory (ftp://
kurobox.serveftp.net:3021/utilities/cd-rom/) which incidently also
carries Spin! in case others reading are interested (the author's
(Julian Reschke) website is no longer available and I can't find a new
one of his.
Ulf Ronald Andersson's website (the author of BETAdos) is still
working though: http://www.ettnet.se/~dlanor/index_nc.htm

OK, that aside I took a new look at BETAdos, understanding that it's
basically a full replacement of METAdos, so it should be improved and
work better, possibly removing my problem of the computer freezing
when no CD media is found in the CD-ROM drive.
So, based on the help I've received here and a little trial and error
I came up with a working configuration meaning I now have a CD-ROM
system which works just like before, but with BETAdos instead of
METAdos. Here's my configuration file (BDCONFIG.SYS) with the original
comments removed:

```
; ### BDCONFIG.SYS file for MetaDOS 3.12 ###
; ########################################
;
; ### CD-ROM on ACSI 3 as XBIOS drive X ###
*BOS, c:\auto\spin_sd.bos, X:3
;
; ### install as logical drive X ###
```

```
; ### Original Atari (METAdos) ISO-9660 support file disabled ###
; ### and replaced by BETAdos' own ISO-9660 support file ###
;
; *DOS, c:\auto\iso9660f.dos, X:X
*DOS, c:\auto\bd_9660f.dos, X:X
;
;
*DOS, c:\auto\cluster.dos, U:0
*DOS, c:\auto\cook_fs.dos, U:1
;
*SLB, c:\auto\slb_load.ovl c:\gemsys\magic\xtension
;
; ### END OF FILE ###
; ########################
```

But getting back to the problem I've been trying to solve; that the computer freezes when no media is found in the CD-ROM drive... Upon booting, one of the message that comes on the screen up is this one:

```
SCSI-treiber V5.00
(c) C. Brod, S. Engel 1994-1996
compiled 03.12.1996 22:28
Initializing SCSI driver....
searching driver modules..
IDEot, ACSI, ALIA, TT, Falcon, MM,
scanning busses...
ACSI... 00 03
scanning done
Installing ACSI-buffer
ACSI 3.0: YAMAHA CRW4416S 1.0G (XHDI)
SPIN! /SD 0.34
installed BOS drive X: using ACSI 3.0 .
BetaDos ISO9660F v1.00
installed DOS drive X: .
Cluster driver v3.07
installed DOS drive U: .
Cookie jar filesystem v1.01
installed DOS drive U: .
```

However, if I boot up with the CD-ROM drive powered up, but no CD disc inserted I only see the following whereby the computer freezes indefinitely:

```
SCSI-treiber V5.00
(c) C. Brod, S. Engel 1994-1996
compiled 03.12.1996 22:28
Initializing SCSI driver....
searching driver modules..
IDEot, ACSI, ALIA, TT, Falcon, MM,
scanning busses...
```

ACSI... 00

So what I'm wondering about now is: what file exactly is the above referring to? And is there anything in BDCONFIG.SYS which could relate to this problem?

Hallvard

It's great to see a free CD-writer tool for our platform. Apart from Anodyne's commercial solution, is there anything else like this?

Unfortunately CDLab seems far from completed. I've spend the better part of an afternoon trying to write a CD without any luck. I'd like to hear from anyone who's gotten it to work.

Even the documentation file isn't complete! But with the aid of ST-guide's own HCP.TTP I was able to compile the .STG file into fully usable .HYP and .REF files which ST-guide could use. Has the author of CDLab forgotten to do this?

Still, I wish the author all the best and I for one am very anxious to get myself a free CD-writer application!

What do you want to burn ?
What is your burner ?

Yvan

I want to burn a normal data CD with text files, images, programs etc.
My burner is a Yamaha CRW-4416s connected to my MegaSTe via a Link 97.
I'm already able to read CDs (ISO-9660) on the MegaSTe with the same
drive.

Data mode burning under CDLAB only supports MMC compliant drives.
The 4416 is too old and doesn't support MMC commands although it's really
close.

I figure that 4416 is supported with my Cdrtools port but it's slightly
complicated.

But I am sure that the old Cdrecorder program from Soundpool manages this
burner drive and it's very easy to use. It was a commercial program but the
existing cracked versions work very well.

Good luck.

Yes, the demo version of HDDRIVER 8.2 is suitable for this test.

> close.

I see.
What exactly is MMC? Wikipedia didn't have any entry that made sense
in regards to this issue.
I've used that writer for years with a Mac together with Adaptec Toast
software. Worked fine for all sorts of stuff. I even backed up all my
Atari software on ISO 9660 CDs which are readable on the MegaSTe.

Would a modern IDE CD (or DVD) writer be better to use?
I'm looking into ways to get IDE support in my ST, but haven't quite
gotten there yet.
Are there any SCSI CD writers with MMC support?

> I figure that 4416 is supported with my Cdrtools port but it's slightly
> complicated.

I prefer easy to use setups :-)

You're right!
With the demo of HDDriver 8.2 the computer no longer freezes if a CD
isn't inserted in the CD-ROM drive when it's booting!
Looks like I need to update HDdriver.

Instead of freezing I now get an error message when Spin! is loading:

BOS error: device not responding
This driver is not installed

So even if I install a CD into the CD-ROM drive later I can't read it.

You mentioned using Spin! together with HDdriver yourself; have you
encountered the same limitation as well as not being able to read CD-
RW discs? If not, perhaps the drive itself (CRW-4416) is the reason
behind it all as, in another thread, I was told it's not an MMC
compliant drive, whatever that is.

Since the CD-ROM driver does not know (and thus does not care) whether a
CD-RW or a plain CD is inserted I assume that your drive does not
support CD-RW discs.
MMC is (as far as I know) a set of standard commands CD-ROM drives are
supposed to support. It may perfectly be possible that SPIN! only
supports MMC-compliant drives.
I do not use a CD-ROM drive with my Atari anymore, so I cannot go into
detail.

It means "Multi-Media Commands". Before, each manufacturer created his own
commands to burn.

> I've used that writer for years with a Mac together with Adaptec Toast
> software. Worked fine for all sorts of stuff. I even backed up all my
> Atari software on ISO 9660 CDs which are readable on the MegaSTe.

Because your tools managed the classic 4416 burner and cdrom read is
standard.

> Would a modern IDE CD (or DVD) writer be better to use?
> I'm looking into ways to get IDE support in my ST, but haven't quite

Should work if SCSIDRV find your drive and your drive is MMC compliant in
the case of Cdlab.

> Are there any SCSI CD writers with MMC support?

Yes, HP cd-writer 9600 maybe 9200.

>> I figure that 4416 is supported with my Cdrtools port but it's slightly

S>scanning busses...
S>ACSI... 00
S>
S>
S>So what I'm wondering about now is: what file exactly is the above
S>referring to?

That's referring to the installation of the SCSIDRV interface, one stage before metados is even being started. So this looks like SCSIDRV doesn't like the optical drive without media inserted, as in the drive is answering somehow differently in this case.

If your HDDRIVER were a little newer (at least 7.0), you wouldn't need SCSIDRV anymore as it's functionality has been integrated. Perhaps that would solve your problem. You could try and test it with the current demo, but I don't know if that one has the SCSIDRV interface fully enabled.

With best regards
Ekkehard

Does anyone know what the difference was between the ICD Link
and Link 2 adapters? Also is "The Translator 2" a DMA->SCSI
adapter (which looks very similar to the ICD Link) the same as a
ICD Link 2?

Cheers

jao

AFAIK the difference between Link & Link2 is that the 2 has an LED to show when it's receiving power on pin? and it handles parity. From my long term memory, could be wrong.

Never heard of the last one.

IMO, you should get at least an ICD adapter. That will support almost
all SCSI hard disks and a good bit of other SCSI stuff too. If you can
afford it (and if you can find one), you might consider getting a Link97
instead. It's upward compatible with ICD adapters, and also supports
SCSI arbitration. This will allow you to connect those devices which
require arbitration (such as most/all CD/DVD recorders & the Daynaport
SCSI/Link).

FYI, the Link97 (like the ICD Link/Link2) is contained in a case at the
end of a cable, so if you go this route (or choose an ICD Link/Link2),
you'll only need to fit drive(s) into your Megafile case.

>

The CRW-4416 is in fact MMC-compliant, but I don't think that's the issue here. Are you *absolutely* sure the drive isn't broken? The drive is responding to an INQUIRY command (that's where HDDRIVER gets the drive name from), but it's possible that it won't respond to other commands. Try it on another system with a known-working SCSI chain and see if it works.

BTW, the usual reason for not being able to read CD-RW disks is using an old drive. CD-RW disks have lower reflectance than CD-R or CD-ROM disks, and older drives just couldn't pick up enough signal. But we're talking about pre-MMC drives here, pretty old stuff ...

What I was able to find was an ICD AdSCSI ST adapter. It looks small enough
that I may be able to fit it inside the MegaFile case. I have a 4GB SCSI
drive that I am going to attempt to use, and if possible will run the cable
out of the case so I can daisy chain other SCSI devices to it.

I used it with a 68K Mac a few weeks ago without any problem, but sold
that computer and currently don't have any other SCSI equipped
computer which I can test it on.
Is there any testing software for the Atari ST which can be used to
check the drive?

# 1556. Alpha release: USB mouse driver v0.80

Newsgroup: comp.sys.atari.st
Date: 2007-07-20 20:08:09 UTC
From: Coda <jan.honza@gmail.com>
Message-ID: <1184962089.537043.246680@d55g2000hsg.googlegroups.com>
Source record: 4970

I have decided to make the latest version of my USB mouse driver
available for public download. This is considered an ALPHA release.
There are things to fix, things to add etc, but it is useable and
works on ST/TT/Falcon with EtherNat or NetUSBee, in TOS and MiNT. As
for MagiC, you'll have to try it, I don't own it, so I can't develop
for it.

Get it from the downloads page on http://www.janthomas.org.uk/ and
don't forget to read the text file before you install it!

Obviously, if you don't have an EtherNAT (http://nature.atari.org) or
a NetUSBee (http://hardware.atari.org) there's no point in downloading
it!

Please let me know if you are using it (via the email address on my
website, NOT the gmail spamtrap address I use for usenet).

Many thanks for your patience and for being unwilling ALPHA
testers! :-)

Coda.

# 1557. SDL 1.2.12

Newsgroup: comp.sys.atari.st
Date: 2007-07-21 09:15:57 UTC
From: Patrice Mandin <pmandin@caramail-NOSPAM.com>
Message-ID: <pan.2007.07.21.09.15.57.19396@caramail-NOSPAM.com>
Source record: 4971

Hello,

Here is a new SDL release, available on my web site:
- Teamtap support (4-joypad adaptors).
- Fixes in mouse and keyboard management.
- Save and restore FPU registers in audio and timer interrupts.
- GEM: allow creation of windows bigger than screen resolution.
- GEM: better mouse grab.
- And more fixes not specific to Atari version.

Thanks to Keith Scroggins for the intensive tests with Scummvm and
Openttd :).

Does anyone know where I can find drivers for a
Forget Me Clock II?

Thanks

jao

Actually I have the original drivers, but they no longer
work (dates seem to be up to 1999 only). I'm wondering
if there are any patches available?

Thanks

jao

Here's a post from Aly from Sept. of last year:

"The problem with th FMCII software is that it won't go past the year
1999.
The hardware RTC is fine, just that the software can't set it.

SOLUTION.

Edit the file FMCII.PRG with a hex editor. Find the first two
occurences of
63h Change these to 6Eh. And save.

Your FMCII.PRG program can now set dates upto 2010. :-))) 2006 is
106 in
the FMC software.

Yayyyyyyyyy!!"

Galen

Web Archive is doing what Hexstar wants to do. If you know the
original webpage, most of the info on it will have been archived since
aobut 1999. The only exception would be material that the author of
the webpage never wanted to be archived.

Ho, Yes. There never will be a better M$ box than the "Falcon"
Xbox360. Anyway the leader of the market is not in very good
position ;)

> Just like Falcon was last computer that Atari produce :)

The Falcon code name was certainly a name given on purpose.
We all know that same causes are producing same effects. So
will it be a good or a bad thing ? Ho well, for me never mind,
I own a PlayStation3 on which I'm willing to run ARAnyM. I'm
convinced to have made the good choice.

Soooooo, if I make a Wii build of hatari (because I got a Wii this
month), will that be a bad thing? AFAIK it doesn't have anything to do
with the name "Falcon".

Please make a Wii Hatari build. If you know how ;-) cos you can't do
homebrew on Wii yet (unless in GC mode). :-/

# 1570. MagiCMac Under Mac Classic

Newsgroup: comp.sys.atari.st
Date: 2007-07-24 02:05:00 UTC
From: FMH <fmhcentral@gmail.com>
Message-ID: <46a52c13_4@newsfeed.slurp.net>
Source record: 4984

Hello,

Has anybody tried and successfully gotten MagiCMac for OS9 to run on a PowerMac in the Classic environment from under OSX? My issue is that I just recently upgraded machines from a G4 Cube to a PowerMac Dual G5. The G5 does not boot natively into OS9. So from OSX I can start the Classic environment (OS9) and try MagiCMac but all I get is a white screen and the system appears to freeze. I never ran Classic on any of my G4 Macs before. If I wanted OS9 I'd just boot into it. Earlier this year I got MagiCMac 6.20 for my Cube and was trying to get MacStip running when I bought my PowerMac G5. Now I'd like to start back where I left off with MagiCMac for OS9 but can not seem to get it running on the G5. I did try some other OS9 apps like iCab and Internet Explorer for OS9 and they appear to run just fine so the Classic Environment seems to be loaded properly on the G5.

That's actually a bit of a tough question.

Firstly the SH205 uses a 20Mb MFM drive, in general these drives are
pretty good.

The controller is quite complex, it converts ASCI to SCSI and then
to ESDI (which the MFM drive uses)- but might be wrong on that.

I heard stories once that it was possible to adapt the controller to
use with SCSI drives, but not sure on that.

Perhaps there is someone more knowledgeable who can help.

Cheers

jao

Source record: 4990

I'm trying to do something similar to you now.

I have a MegaFile 60 with a dying drive mechanism. From what I understand the SH 205 is a MegaFile 20 and may be very similar to what I have. The mechanism in mine is a 5.25" 60MB RLL drive. From what I understand, the controller in this drive serves two functions. It converts ACSI to SCSI, and then connects SCSI to RLL. However, since this logic is internal, I don't know how feasible it would be to try to modify the board to be able to connect a SCSI drive to it.

I just got an ICD AdSCSI ST host adapter, and am planning on ripping the guts out of the case and installing the ICD board and a 4GB SCSI drive in the case.

# 1574. TeraDesk 3.92 released

Newsgroup: comp.sys.atari.st
Date: 2007-07-24 19:07:02 UTC
From: vdjole@EUnet.yu
Message-ID: <f85ikj$gau$1@news.eunet.yu>
Source record: 4989

Hello all;

Version 3.92 of TeraDesk open-source desktop for the 16-bit and 32-bit lines of Atari computers is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

This release brings a small change (just five lines of code) made to set TeraDesk in agreement with Didier Mequignon's PICDESK utility for displaying desktop background pictures. Recently, an inquiry from a user made me aware of the existence of PICDESK, and it turned out that TeraDesk was already pretty much compatible with it- the picture was displayed, but there were some bad redraws. Only small corrections were needed to fix that.

See the history file and/or the hypertext manual for more information (i.e. how to set TeraDesk to enable display of desktop background pictures).

Btw. it seems that there is a bug in PICDESK: if it is set (and configuration saved) to display a monochrome IMG picture, on the next startup it attempts to display a GEM picture instead- and so nothing happens until a picture file is manually reselected.

Bbtw. PICDESK is not needed if one is using MyAES; that AES has a capability to display desktop backgropund pictures. Also, it seems that PICDESK does not work with XaAES (but is ok with Atari AESes, N.AES, Geneva and MagiC).

In TeraDesk 3.92 there are also some other small improvements and bug fixes.

Have fun.

That's AFAIK just impossible...

> Earlier this year I got MagiCMac 6.20 for my Cube and was trying to get
> MacStip running when I bought my PowerMac G5.

How often must I still repeat myself? MacSTip as a part of MacTCP-
Connect is a crude hack that runs only with Old World ROM machines!
Your Cube simply isn't an Old World ROM machine and therefore MacSTip
won't work on it - there's definitively just no way...

---------- <nibble here off> ----------
All Macs prior to the iMac use Old World ROM, while the iMac and all
subsequent models are New World ROM machines. In common use, the "Old
World" designation usually applies to the early generations of PCI-
based "beige" Power Macs (and sometimes the very first NuBus-equipped
models)
---------- </nibble here off> ----------

ï¿½ <http://en.wikipedia.org/wiki/Old_World_ROM>

I built a my first HD with a 60MB Seagate RLL drive and Supra Host Adapter.
The HA converts to SCSI. Then a card inside the case translates to the RLL
drive. The card is actually the SCSI device. AFAIK the card was just
miniaturized to where it could be put on the drive making it a SCSI device.
Connecting a HA directly to a SCSI drive(s) is all that's needed.

Don't think the Atari HA is a good idea , even if physically possible, but
leave that to those more knowledgeable. The HA will need to support the new
drive.

On my later SCSI drives just used 50 conductor ribbon cable, a 50 pin IDC
connectors on the drive and 2(if needed) 50 pin IDC centronics connectors on
the outside with a Link HA on one of them. A centronics connector could be
run to the outside from the internal HA as well. Come to think of it, did do

that with the Supra too before getting the Link. Then there's termination.

I've also got 135&230MB SyQuests, a Floptical, 2 CD-ROMs and a 540MB Quantum drive in an Atari ST 3.5" floppy case that can be chained. The Quantum requires parity so can't be used with either of these HA, unfortunately. Also unfortunate that it's been a long time since playing with them.

Well, the way I heard it is that the wii devkit is due out next month,
it'll cost about $250 and it'll have some hardware too. Doesn't sound
TOO bad actually :) (although someone will have to build libSDL for
it ;)

# 1580. Transfers between Hard Drives

Newsgroup: comp.sys.atari.st
Date: 2007-07-25 13:20:17 UTC
From: Jason Harmon <jharmon@us.net>
Message-ID: <4KmdnZ0MNNoWzTrbnZ2dnUVZ_sytnZ2d@comcast.com>

In my quest to replace my dying MegaFile 60, I've put together a new hard drive system based on an ICD AdSCSI ST connected to a 4GB SCSI drive. I've got the new drive configured with the latest ICD SCSI drivers, a 16MB boot partition, and a whole bunch of 256MB data partitions.

The big question I have is on how I can transfer data between my old drive and my new one. Let's ignore for the moment all the bad sectors, etc on the old drive.

Is there a way to connect both the ICD AdSCSI and the megafile at the same time so that I can just copy files between the drives? I had tried to daisy chain the MegaFile from the "out" port on the ICD adapter, but when I did that the system would not boot from either hard drive.

Any useful pointers would be appreciated.

Thanks.

My mistake I meant MacTCP-Connect I wanted to set up. I know what an Old World Machine is as I have a couple 8500-120, 9500MP, and a 9600-200 which any of them could then run Mac-Stip. How then did Bengy at http://www.magical-sides.de the old MagiC Support Site run MacTCP-Connect on a G3-333 iMac? That was not an Old World Machine?

Like my original post said I had just gotten MagiCMac for OS/9 and was trying to setup up the TCP/IP connection with the Mac OS and MagiC when I got a new machine so I never did actually get it working. It appears that on my new G5 it is not possible to run MagiC under the Classic Environment. Stinks but not really that big a deal as I have other Macs in my office that I can run OS9. I would have just preferred to have as much as possible running on my G5.

If MagiCMac for OSX has TCP capability then I may be willing to spend the money to purchase it.

I have heard that Magic Mac won't work with OS 9.2. But it may work
with a version of OS 9 up till 9.2, like 9.0 to 9.1.x
Classic is always going to be 9.2

Andreas Kromke mentioned that the only way that there would be a TCP/IP
driver for MagiCMacX would be if someone wrote the necessary module.

I thought that there was a certain amount of shooting oneself in the
foot, but let's face it, the Internet browsing experience on the Mac is
much better!

It might work with another driver. HDDRIVER is prepared for handling
SCSI and ACSI drives in a mixed setup if a Link-compatible adapter is
present. Since this setup is unusual I have never extensively tested it,
though. What I would expect to work is a Megafile drive directly
connected to the ST, a Link adapter connected to the DMA OUT port of the
Megafile drive, and a SCSI drive connected to the Link.
You can use the HDDRIVER demo version
(http://www.seimet.de/hddriver_english.html) in order to check whether
you can use HDDRIVER at all with your hardware setup. Running the
ID-check should be sufficient. If both drives are recognized things look
good and HDDRIVER should be able to properly access both drives.

Version 3.92 of TeraDesk open-source desktop for the 16-bit and 32-bit lines of Atari computers is (again) available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

The initial release of this version (program dated July 20th) contained a bug that disabled it on systems with more than a few megabytes of RAM. This bug has now been fixed. The corrected version of the program is dated July 25th 2007.

Sorry for the inconvenience.

Have fun.

# 1594. Re: Transfers between Hard Drives

Newsgroup: comp.sys.atari.st
Date: 2007-07-26 12:25:47 UTC
From: Jason Harmon <jharmon@us.net>
Message-ID: <kOydnZ2DNLEJDzXbnZ2dnUVZ_v2unZ2d@comcast.com>
Source record: 4908

I tried this out (booting from floppy and then loading the trial HDDRIVER from it).

Unfortunately, the behvavior I got was rather random, with the system seeing only the AdSCSI and not the MegaFile. I tried both orders in the ACSI chain but in no case could I get the system to see both drives, although once it saw the MegaFile and not the AdSCSI.

I was wondering if there is some sort of "ACSI ID" that needs to be set to allow the computer to distinguish between multiple ACSI devices attached to the system. I certainly have not heard of this, and there are no jumpers on the AdSCSI board to allow this to be set.

I guess my only option may be to simply find a stack of 720K floppies and use some backup software to backup and restore that way.

Thanks.

Check that you have different SCSI IDs.

Also you say you have a "bunch of partitions". TOS does has a limit
(16?) on the number you can have IIRC.

Hi there,

I have a couple of suggestions before you start searching for your old
disk boxes.

Firstly, if you have a PC with a SCSI card you can connect the disk
there, make a disk image and then extract the files from it, or if you
use linux you can mount the disk directly. A PCI SCSI card should be
dirt cheap to get hold of if you don't have one.

Also, another idea would be to make (or buy) a cross serial cable and
use Ghostlink on window$ or do$ to transfer files from the old disk to
your PC partition and then get them back from there for your new disk.

If you find any of these 2 ideas attractive then I could dig up some
links for you. Hope this helps.

The problem with this method is that the old drive in the MegaFile is not SCSI. It is an RLL drive (the MegaFile has a ACSI->SCSI->RLL controller in it, so without some additional hardware there is no way to hook it up to my PC's SCSI card.

If there is some software than can easily transfer a whole hard drive over serial to a PC, that would be great.

You have to ensure that both drives use different IDs. There are jumpers
somewhere on the Megafile board to change the ID, and there are also
jumpers on your SCSI drive to set the ID.
The AdSCSI does not have jumpers since the settings must be changed on
the drives, not on the adaptor.

Ok, I may have misunderstood how this worked. I believe the AdSCSI is fixed as ID 6, and my SCSI drive connected to it is ID 0.

I was under the (probably mistaken) impression that devices connected to a seperate ACSI controller would be part of a seperate SCSI chains and would not collide with those on a different controller (similar to having 2 SCSI cards in a PC and having different drives connected to each card).

However, I will make sure the jumpers on the MegaFile board aren't set to 0 or 6 and see what happens.

Thanks.

Thanks for the Ghostlink suggestion. While its a bit slow, it is certainly
easy to use and seems to be doing what I need it to.

# 1603. ANSI C Compiler

Newsgroup: comp.sys.atari.st
Date: 2007-07-27 03:15:25 UTC
From: Jason Harmon <jharmon@us.net>
Message-ID: <F4GdnVvoIq-J_jTbnZ2dnUVZ_oCvnZ2d@comcast.com>
Source record: 4917

Does anyone have recommendation on the best ANSI C compiler for the ST? I have some utility apps I wrote that I would like to port to the ST, but the only C compiler I have is Megamax which is K&R and not ANSI.

I heard that Borland released Turbo C for the ST... Does anyone have a copy of this? I own the DOS version and an ST version would be great.

Thanks.

Jason Harmon

Go to http://rg.atari.org/source.htm, you can download a copy from
there. Also, there's Reservoir Gods' Godlib there, which has a wealth
of ST specific code there (mostly for games though). Now if you want
to delve into GEM programming, I really can't suggest anything right
now.

Yep, that's the idea, and since you'll only be doing it once you can
drag your partitions to the ghostlink drive and let it rip.Of course
another method would be to use ethernet, but it's a bit hard (I think)
to get one and it requires some setting up to do.

I didn't know Turbo C was released for Atari. What I heard was that
Pure C became Turbo C on the PC. In fact I have used both and they are
very similar animals. I loved Turbo C in DOS (sorry for the bad
language) because it had a great IDE and the online help was
fantastic. As far as I know there is very little English documentation
for Pure C (just a long readme) the proper manuals are in German.
That's probably why these days I use Lattice C 5.6, I bought it
especially to make sure I had all the manuals, and boy I have needed
them...

Or, you can use GNU C. You may know that you can switch it to several
different C standards, and it will also compile other languages like C+
+, Fortran, Pascal (ugh!) etc. This is of course free software, and
there is plenty of documentation on the net. I don't know which Atari
specific libraries exist though, but I know they exist.

Good luck.

What I would like to see, is a way by which all we atari owners can
pitch in five or ten dollars a month to an Atari Developer Fund, which
at the end of every month, quarter, or year gets devided amongst all the
active developers.

What do you all think?

Hi,

> What do you all think?
I can only talk only for me, but I don´t need this. I write my programs for fun. So, in my opinion it would be better to write an email to the authors and say just "Thank you" than organize a "developer fund" where you probably get 20 Bucks a year to divide.:-) Most people are to lazy to write an email to the author, why should they busier to spend money? Most of the programmers that are active for Atari today are people with jobs and I think they do not need the money, but what they like is a little bit honour.

Bye

Source record: 4929

Hello all,

Well I am getting clost to putting my Falcon in my old Hades tower. I have the cables to extend the ports to the outside for the cartridge, printer, MIDI, keyboard, joystick, video. I have the SCSI and IDE ports taken care of. I took out the motherboard and traced it on a piece of cardboard. I tested the cardboard shape in my tower to see if it would fit. It looks like the bottom two bays are in the way. My tower has six bays and I only use 4. I guess I would have get a four-bay apparatus and use that or just get a new tower.

I am also looking for a new ATX PSU. What wattage is good?

Any suggestions or comments are welcome.

Wattage is mostly irrelevant. Good quality stable outputs are what you
need.

I run my CT60 falcon on one of these:

http://www.mini-box.com/M1-ATX-90w-Intelligent-Automotive-DC-DC-Power-Supply?sc=8&category
=13

My related post on DHS: http://bbs.dhs.nu/ct60/index.php?request=2543
stated 2 years ago that my CT60 falcon only drew 38W. At that time I
was thinking about using an Xbox PSU as it seemed almost good enough
to work but for the price of an M1-ATX and the fact that it plugs and
goes (and fits behind the CT60 in the original case without the CTEX)
there was no competition. Oh, it's silent too :)

If you decide to go this route, don't get tempted to buy the M2. It's
overall power rating is higher, but only because of the huge 12V
supply (designed for P4 mobo's). There is less amperage available on
the 3.3V and 5v lines.

What I am looking at is a 230 Watt PSU with a switch on the back. It has three IDE 4 pin connectors, one floppy connector and AUX connector. What is this AUX connector?. That should be enough for me I would think and I only need 4 connectors including the floppy. You can see it at:

http://www.supernotebook.com/micro-atx-power-supply-powermax-230-watt.htm

Tell me what you think.

Hello again,

Well it looks like I will be able to use the old Hades tower. I just have to move all of my external hardware up 2 bays, so that the bottom two are empty. Then I have to cut part of the bottom bays out and the Falcon board will fit.

Now I have another question. I know the Falconmother board cannot touch the metal fram of the tower. I was thinking of using nylon parts (screws, nuts, rings etc) to attach the board. Is this a good idea or is there something else I could use?

I cant reach that webpage, gives me a 404.
If its a 4 pin AUX connector then its probably the extra 12V line
needed for some P4 motherboards. If that's the case a lot of that 230W
will be provided at 12V. Not something you need. Especially as it
means that the currents available at 5 and 3.3v will be greatly
reduced.
